He owed his vindication to his dialogue *Eranistes*, the first work of its kind in which the speakers' names are indicated only in the margins. The form is more dramatic than the content, for all the best lines are awarded to Orthodoxus, as he responds to the inquiries of a sceptical but deferential pupil. The premiss of his orthodoxy (one that Cyril would not have disputed) is that the Godhead must remain changeless and impassible in its union with humanity. The epithets that the manuscripts give as titles to the three parts of the dialogue are *atreptos* (immutable), *asynchytos* (unconfused), and *apathes* (impassible). Each part is succeeded by an eclectic florilegium, drawing on eastern and western sources, which illustrates both the learning of Theodoret and his eirenic disposition. For him, as for all theologians of his time, the chief authority is scripture: drawing a metaphor from John 2: 21, he argues that the body of Christ is his temple, not his person, and that the manhood is what God assumed, but not what he became. The resultant thesis, like that of Nestorius, belongs to the

Antiochene tradition in Christology, which declines to add speculation to the statements of the Bible, and insists upon the inconvertibility of the human and divine. Theodoret is careful, however, not to ascribe two persons or *prosopa* to the incarnate Christ, as Nestorius seems to have done, and therefore the fourth anathema of Cyril's Third Letter could not apply to him. His formula "one person in two natures" was adopted by the Chalcedonian Council in the teeth of the Monophysites, who soon fell into schism. Nevertheless, the party of Cyril continued to rage against him, and in 553 he was posthumously condemned by the Second Council of Constantinople, along with the great Antiochene exegete Theodore of Mopsuestia, who is often thought to have been the mentor of Nestorianism.

His works, however (unlike most of Theodore's), survived his condemnation. The *Ecclesiastical History*, one of many continuations of Eusebius, covers the interval from Constantine to the outbreak of the Nestorian controversy in 428. It is, like all its rivals, a mixture of good and bad reporting, punctuated by original documents that retain their value for the modern scholar. A combination of hearsay and firsthand knowledge produced his *Religious History*, an anecdotal record of the Syrian Desert Fathers. Competing with the popular *Lausiac History* of Palladius, this work proved that the extremes of self-denial, and even novel forms of it such as living on top of pillars, could be practised outside Egypt. There is more polemic than scholarship in his *Curatio Omnium Affectuum Graecorum* (*Therapy for All the Greek Diseases*), which purports to be a therapeutic guide to the philosophic roots of heresy. The biographical details are of more interest to modern readers than his summaries of doctrine, and one could almost say the same of his commentaries on the Pauline letters. These are a stock example of the Antiochene exegesis, which treated the letters not (in the Alexandrian way) as libraries of prooftexts, but as pedagogic documents designed to meet peculiar circumstances. Most of Theodoret's comments are abridged from the more eloquent and copious observations of John Chrysostom, but he offers an original contribution in his prefaces, which explain the situation of both the apostle Paul and his audience in each letter. Rather than allegorize a difficult passage, he is more likely to commend the rhetorical flattery (*psychagogia*) by which the apostle works upon the feelings of his hearers. It is only in recent times that biblical scholarship has retrieved his sense of history, though the King James Bible incorporates the epigraphs in which he states each letter's place of origin. Unfortunately, most of these are no more credible than his attempts to prove, against the obvious meaning of Galatians 1: 19, that James was not the brother of the Lord.

Theodoret has rarely detained the attention of either scholars or theologians, though Protestant controversialists have quoted him against the doctrine of transubstantiation. He was neither saint nor heretic, neither scholar nor ignoramus, but a pious churchman snatched from willing obscurity by the troubles of his age.

MARK EDWARDS

Biography

Born *c.*393 in Antioch, Theodoret received a Classical education and entered a monastery in Syria. In 423 he became bishop of Cyrrhus and was frequently involved in controversy, supporting Nestorius against Cyril in 431. In 449 Theodoret was exiled, but later recalled. His writings include the dialogue *Eranistes*, the *Ecclesiastical History*, the *Religious History*, and other discourses. He died *c.*466.

Theology

"Theology, study of the highest problems in the universe by means of philosophical reason, is a specifically Greek creation. It is the loftiest and most daring venture of the intellect" (Werner Jaeger in *Paideia*, vol. 2, Oxford: Blackwell, 1944). Plato was the first great theologian, and he appears to be the first to use the term *theologia*; the speculations of the Presocratic philosophers about the origin of everything, however, were regarded as "theologizing" by Aristotle, who ranks their speculations with the cosmogonic notions of poets such as Hesiod and Homer, whom he called "theologians", *theologoi*. For Plato, theology was the study of eternal realities, that is the realm of the Forms or Ideas. For his pupil Aristotle, theology was the study of the highest form of reality, the "first substance", which he seems to have regarded at different times as being the "unmoved mover" or as "being *qua* being"; he spoke of three theoretical, or speculative, ways of knowing, the mathematical, the physical, and the theological, theology being the "most honourable". Such a notion of theology as the study of, or contemplation (*theoria*) of, the highest form of reality was a commonplace in the Hellenistic philosophy of the Roman world in which Christianity first emerged. But that was a world in which the quest for God had for many, besides Christians, a certain urgency: the realization of the highest contemplative exercise of the mind acquired a religious colouring. The "lower" studies of logic, ethics, and the understanding of the natural order became a sequence of preparatory training for communion with the divine, seen as fulfilment. These ideas very quickly found acceptance among Christian thinkers, so that in the 3rd century Origen saw three stages in the Christian's advance to communion with God, the ethical, the physical, and the "epoptic" or visionary, a triad that found

its classical form in the 4th century with Evagrius, the theorist of the monastic asceticism of the Egyptian desert: *praktike* (ascetic struggle), *physike* (contemplation of the natural order), and *theologia* (theology as contemplation of God). Such an understanding of theology as essentially prayer or contemplation, the highest exercise of the human mind or heart, the fruit of sustained ascetic struggle, quickly established itself in Greek Christianity, and is still fundamental in Orthodox theology. It is expressed succinctly in Evagrius' oft-quoted assertion: "If you are a theologian, you will pray truly; if you pray truly, you will be a theologian."

Alongside such an understanding of theology as a state to be attained, theology is also used among Christian thinkers to mean study of the nature of the divine, in a way very similar to its Classical Greek usage. The God of the Christians is not, however, some remote principle, but one who has revealed himself, not only through the works of nature, but also in his dealings with his chosen people, Israel, and pre-eminently in the incarnation of the Son or Word of God: in those events to which the writings of the Old and New Testaments bear record. In patristic and Byzantine thought a distinction is often made between *theologia* and *oikonomia*, *theologia* referring to the doctrine of God himself, and *oikonomia* to God's dealings with his creation, especially in the Incarnation. *Theologia*, in this restricted sense, means the doctrine of the Holy Trinity, and the names (or properties) of God. Within theology in this sense a distinction is further made between kataphatic and apophatic theology, that is between theology that makes affirmation (*kataphasis*) of what is revealed of God through the created order and scripture, and theology that points to the transcendent nature of God by denial (*apophasis*) of any of the concepts or images by which we seek to express an understanding of God. The idea that God is most surely approached by denial of our concepts and images of him can be traced back to the roots of both the Classical tradition (e.g. Plato's assertion that the Idea of the Good is "beyond being and knowledge") and the Hebrew tradition (e.g. God's riddling revelation of himself to Moses as "I am that I am"), and is strongly asserted in the 4th century by the Cappadocian Fathers and St John Chrysostom. The terminology of *apophatic* and *kataphatic*, in a theological context, is first found in the Neoplatonist Proclus, and was introduced into Christian theology by Dionysius the Areopagite in the 6th century. It quickly became popular in Byzantine theology. Of the two, apophatic theology is understood to be more fundamental, undergirding the theology of affirmation, while appearing to undermine it. In the idea that God is most truly known, not in concepts or images that the human mind can grasp, but in a movement beyond them in which God is acknowledged in silent wonder as transcendent, theology as doctrine is united with the notion, more fundamental to the Orthodox mind, of theology as prayer.

The consequences of the conviction of the more fundamental nature of apophatic theology are profound. A realization of the ultimate inadequacy of the human intellect paves the way for a recognition of the place of poetry and imagery of the most diverse kinds in any attempt to express human understanding of the reality of God. It is no coincidence that the great theologian of apophatic theology, Dionysius the Areopagite, speaks not of predicating terms of God, but of praising him by ascribing names to him; nor is it a coincidence that the same theologian devotes much space to exploring the nature of the liturgical action in which the sacraments of the Church are celebrated, seeing in this liturgical action a reflection of the heavenly liturgy of the angelic beings. Orthodox tradition grants the title *theologos* to only three people: John the Evangelist, Gregory of Nazianzus, and Symeon the New Theologian. John's Gospel is the one that most aspires to the form of poetry, and the other two "theologians" were both poets. The liturgical poetry of the Orthodox Church is a vast repository of theological reflection: theology presented in the form of song.

The theology of the Orthodox Church, in the broader sense, including both *theologia* and *oikonomia*, is an attempt to express in terms of Greek intellectual culture the revelation of God that found its fullest form in the Incarnation and to which the canonical scriptures bear witness. At its most fundamental level, theology is a sustained meditation on the scriptures, read in a "sophianic" way, that is, read as a confirmation of the witness to God found in the cosmos, created through his wisdom (*sophia*), and especially in the human person created in God's image and likeness. Such an approach finds different levels of meaning in scripture, and sees in the advance through these levels to deeper forms of understanding an adumbration of the Christian life. Christian thinkers departed from such a pondering on scripture only in order to meet challenges from outside, in defending Christianity from attacks by pagan and Jewish critics, and from within, from heretics. In due course this process led to dogmatic definitions, intended not so much to define what ultimately lies beyond human understanding (in dogmatic theology, too, the apophatic principle applies), as to prevent human misunderstanding of the nature of God and his ways with humanity and the cosmos. The most important of these definitions were endorsed by church councils, or synods, especially "ecumenical" councils (from *oikoumene*, "the inhabited [world]"), called in Byzantine times by the emperor. The Orthodox Church recognizes seven such ecumenical councils. The decisions of these councils represent for the Orthodox Church a further level of authority, irrefragable, though open to interpretation, beyond that of scripture, on which it reposes. The decisions of the councils themselves make it clear that they represent a crystallization of the authority of the Fathers (conciliar definitions are commonly prefaced by the phrase "Following the holy fathers").

The first two ecumenical councils (held at Nicaea in 325 and Constantinople in 381) defined the doctrine of the Trinity, which holds the three persons to be co-equal, the Son and the Spirit each *homoousios* ("consubstantial", i.e. "having the same essence") with the Father. The next four councils (Ephesus 431, Chalcedon 451, Constantinople II and III, 553 and 680–81) were principally concerned with defining Orthodox belief in the Incarnation, affirming that the Son of God, being perfect God, assumed a perfect humanity, "*homoousios* with us" and like us in all respects save for sin: these two natures (*physeis*) being united in the person (*hypostasis*) of the Son. A consequence of this definition is that the Virgin Mary is truly *Theotokos* ("one who gave birth to God") and, as Constantinople III affirmed, that the natures, being perfect, both possess their natural activity (*energeia*) and will (*thelema*). The Seventh Ecumenical Council (Nicaea II,

787) defended the veneration of icons or images of Christ, the Mother of God, and the saints, as entailed by God's assumption of a material human form in the Incarnation. The witness of the ecumenical councils is, then, to the fundamental doctrines of *theologia*, the Trinity, and of *oikonomia*, the Incarnation, the veneration of icons being regarded as a matter of Christology.

Thereafter, theological concern in the Byzantine world, apart from some controversy about the doctrine of the Trinity (including the question of the procession of the Holy Spirit, whether from the Father "alone", as Photios defined it in the 9th century, or from the Son also (*filioque*), as the West came to affirm), the reality of Christ's presence in the Eucharist, and the nature of the Eucharistic sacrifice, focused on matters directly affecting the spiritual life. These concerned the reality of the experience of God in prayer, and how such experience of the presence of God himself could be reconciled with the apophatic assertion of God's transcendent ineffability. Controversy broke out in the 14th century in which solitary monks known as "hesychasts" (from *hesychia*, meaning stillness), who claimed in prayer to experience transfiguration in the uncreated light of the Godhead, were defended from charges of hallucination by St Gregory Palamas, archbishop of Thessalonica from 1347 to 1359. Central to Palamas's defence of hesychasm was his distinction (based on earlier Fathers) between God's essence and his energies: both essence and energies are God, and therefore uncreated, but in his essence God is unknowable, whereas in his energies (or activities) God makes himself known. Palamite doctrine was endorsed by synods held in Constantinople between 1341 and 1351.

After the fall of Constantinople in 1453, Orthodox theology, whether among the Greeks or the Slavs, became defensive, and ultimately entangled in the concepts and terminology of western theology (notably in the "Symbolic Books", endorsed at the synods of Jassy, 1642, and Jerusalem, 1672). A decisive moment in the renewal in modern times of Orthodox theology, based on the theology of the Fathers, was the publication of the *Philokalia* in 1782 by St Nikodimos of the Holy Mountain and St Makarios of Corinth. This anthology of largely ascetic writings from the Fathers, notably St Maximos the Confessor and St Gregory Palamas, soon translated into Slavonic and Russian, is the inspiration behind the "Neo-patristic synthesis" that Father Georges Florovsky (1893–1979) hoped modern Orthodox theology might become. Perhaps the most comprehensive attempt to explore what such a synthesis might be can be found in the works of the Romanian theologian, archpriest Dumitru Stăniloae (1903–93). In a complementary way, the Philokalic vision found poetic expression in the writings of the uneducated Russian peasant St Silouan (1866–1938) who became a monk of the Holy Mountain.

Theophanes of Crete *c.*1490–1559

Monk and painter

Theophanes of Crete (also known as Theophanes Strelitzas and Theophanes Bathas), Greek monk and painter, was a native of Candia, the modern Herakleion. He became one of the foremost representatives of the Cretan school of wall and icon painting that flourished in Venetian- and Ottoman-ruled Greece during the 16th century. His distinctive style is characterized by an ability to fit balanced compositions into available wall spaces, and by dramatic and realistic figures. The primary influence on his work appears to have been the Constantinopolitan painters of the 14th-and 15th-century Palaiologan renaissance, some of whom worked on Crete for a time, especially after the fall of Constantinople in 1453. Examples of their wall paintings survive in a number of Cretan churches, so that it is likely that Theophanes had seen them and that they provided a starting point for his own.

It would seem, however, that Theophanes was also influenced by contemporary Italian art, no doubt as a result of his being brought up on Crete which was then under Venetian rule. The similarity of some of his compositions to the work of the engraver Marcantonio Raimondi, particularly in his depiction of the Massacre of the Innocents, has been noted, and the influence of the Venetian painter Giovanni Bellini has been discerned in some of the figures in Theophanes's *Supper at Emmaus* (now in the katholikon of the Great Lavra on Mount Athos), particularly that of a shepherd in a fur hat. Theophanes's interest in using white highlights to achieve a realistic depiction of clothing and drapery also suggests Italian influence.

Theophanes's earliest known work is to be found in the *katholikon* or monastery church of St Nicholas Anapavsas at Meteora in Thessaly. His frescos, which according to an inscription over the door were completed in October 1527, cover the walls and vaults, inserting small-scale scenes into restricted spaces. Particularly impressive is his large scene showing the death of the Syrian monk Ephraim, and his burial with an icon laid on his breast.

In 1535 Theophanes became the first Cretan to be invited to

work at the Great Lavra on Mount Athos. Taking his sons Symeon and Niphon/Neophytos with him, he worked on the much larger expanses of wall in the *katholikon* there for about five years. The result was some of his finest work, especially his depiction of the *Massacre of the Innocents*, the *Supper at Emmaus*, and the *Transfiguration*, all of which are distinguished by hard-edged drapery and a dramatic impression of movement. Theophanes may also have participated in the decoration of the refectory of the Great Lavra between 1535 and 1540.

Together with his son Symeon, Theophanes also painted the walls of the *katholikon*, refectory, and tiny side chapel of the monastery of Stavronikita on Athos in 1545–46. Although these frescos have since been overpainted, enough remains to identify Theophanes's style, for example in the carefully executed creases in the tablecloth in the depiction of the *Last Supper*. In 1552 he returned to Meteora, where he supervised the painting of the dome of the *katholikon* in the Great Meteoron.

Apart from his work as a fresco painter, Theophanes is also thought to have been a painter of icons. Although those icons that are attributed to him are not signed, they show all the hallmarks of his style, when compared to his known mural work. The icon of Christ Pantokrator in the modern marble iconostasis in the *katholikon* of the Great Lavra, for example, is very similar to the figure in the dome in the *katholikon* in the Great Meteoron. The surviving 11 icons in a series of 12 depicting the *Dodekaorton*, or 12 great feasts of the Christian Church, also at the Great Lavra, are likewise attributed to him. That which depicts the Nativity has a great deal in common with Theophanes's treatment of the same subject at St Nicholas Anapavsas.

Another series of 28 icons, in the monastery of Stavronikita, is thought to be Theophanes's work, and to date from around 1546 when he was working on the monastery's *katholikon* and refectory. In the Protaton, the chief church of Karyes, the administrative centre of Athos, a series of seven icons makes up a Deësis, a depiction of Christ with the Virgin and John the Baptist interceding on either side. An inscription on the icon of John the Baptist dates the composition to around 1542, and the treatment of the figures suggests the hand of Theophanes of Crete.

After Theophanes's death his work remained an important influence on subsequent Greek wall painters, especially those working on Mount Athos. The influence of his workshop can be seen in numerous other decorations on the Holy Mountain, such as the refectory of the Philotheou monastery (1539–40). As late as 1730, when the monk Dionysios of Phourna published a *Hermeneia*, or manual of painting, it was to Theophanes's work that he turned to provide examples of perfection in the painter's art.

Biography

Born in Candia (modern Herakleion) *c.*1490, Theophanes was a monk who became one of the principal representatives of the Cretan school of painting. He was influenced by both Constantinopolitan and Italian painters. His work, in the form of both wall and icon painting, is to be found in the monasteries of Meteora and Mount Athos. He died in 1559.

Theophanes the Confessor, St *c.*760–818

Monastic leader and historian

Theophanes's main claim to fame is the historical opus entitled the *Chronography* (*Chronographia*). He was also a leading monastic figure, earning the epithet Confessor for his support of the icons during the first years of the second period of iconoclasm (815–43).

Theophanes was born into a wealthy family. His father, Isaac, was *droungarios* (commander) of the imperial fleet in the Aegean under Constantine V (741–75) and a close friend of Constantine's son and successor Leo IV (775–80). Leo was Theophanes's godfather and, after Isaac's death, his guardian. In Leo's reign the youth was made a *strator* (or subaltern officer) and then *spatharios* (sword bearer), becoming engaged to and then marrying Megalo, the daughter of a prominent patrician and confidant of the emperor.

Despite their fortune, Theophanes and Megalo decided not to consummate their marriage, preferring the monastic life instead. Each went their separate ways after having sold or given away their possessions, much to the horror of their families. In about 780/81 Theophanes left Constantinople and entered the monastery of Polichnion on the slopes of Mount Sigriane near ancient Cyzicus on the Asian side of the Sea of Marmara, where he may have been tonsured. This monastery appears to have been on one of his father's estates, but Theophanes left it to build a monastery on land he owned on the nearby island of Calonymus. Resisting attempts by the monks there to elect him *higoumenos* (or abbot), Theophanes spent six years in relative seclusion reading and writing. None of his works from this period appears to have survived and their nature remains unknown. At the end of this period he returned to Sigriane and entered the monastery of the renowned monk Christopher (patriarch Methodios's *Life* of Theophanes suggests that he was only then tonsured). Around 786/87, however, he purchased a tract of land nearby and built his most famous monastery, the Agros, soon to became known

as Megas Agros to distinguish it from Christopher's monastery (now the Mikros Agros).

Theophanes's *Lives* state that he accompanied Christopher to the Seventh Ecumenical Council of Nicaea II (787), where the empress Irene restored the icons. While unsubstantiated, the claim is not impossible. He remained in the Megas Agros monastery until the outbreak of the second period of iconoclasm in 815.

The monastery of Megas Agros appears to have been a thriving coenobitic community by the first decade of the 9th century, with its own estates and daughter monasteries (*metochia*), all under the ultimate guidance of Theophanes. His reputation as well as his family links to powerful people in the capital appear to have brought him into close contact with the patriarch Tarasios (784–806) and high state and church officials, including the patriarch's *synkellos* (cell companion), George (see below). He supported the patriarch in his stand against Theodore of Stoudios and his monks during the controversies over the "adulterous" second marriage of Constantine VI (795–99 and 808–11) and is at times negative in his *Chronographia* about Stoudite conduct between 790/91 and 813. Nevertheless, Theodore's own letters (edited Fatouros, 1991–92, nos 319, 333) indicate that Theophanes was Theodore's spiritual father and that Theodore and many others held him in especially high regard. (Two of Theodore's letters are addressed to Theophanes: Fatouros, nos 214, 291.) Theodore even wrote an encomium for him around 820 on the translation of his relics back to the Megas Agros monastery (see Vorst, 1912). This text includes our only physical description of Theophanes, who seems to have been of a robust, soldier-like build. Constantine VII (913–59) proudly claimed in his *De Administrando Imperio* that on his mother's side he was related to Theophanes.

Theophanes and Theodore both refused to accept the restoration of iconoclasm by Leo V (813–20) in 815. Both were among the *hegoumenoi* of the empire's most distinguished monasteries, whom Leo was particularly keen to recruit to his cause. One of the few who resisted the emperor's bribes and threats, Theophanes was consequently imprisoned in the Hormisdas monastery (Sts Sergius and Bacchus) and then in the Eleutherios palace, both in Constantinople, prior to exile on the island of Samothrace in 818, where he died on 12 March, just 23 days after arrival.

Theophanes was a close friend of George, a *synkellos* of the patriarch Tarasios, who was writing a history from the creation to his own day when he fell ill around 810. George asked Theophanes to complete the work, and the result was Theophanes's *Chronographia* which recounted events from 284 to the beginning of the reign of Leo V.

The resulting work is mostly a collation of the edited works of previous chroniclers and historians, and scholars have debated whether Theophanes's own hand can be found therein. Cyril Mango's assertion (*Zbornik Radova–Vizsantološkog Instituta*, 18 (1978): pp. 9–17) that Theophanes had very little to do with the compilation process, and that hardly any comments of his own are to be found in the work, is not widely accepted; this despite Theophanes's own self-deprecating words to that effect in his preface, a topos that would become typical in the prefaces of later chroniclers.

The *Chronographia* is arranged in strict chronological order, with years highlighted by various dating systems, ranging from the Alexandrian *Anno Mundi* to the regnal years of emperors, shahs, caliphs, popes, and patriarchs. A few serious chronological oversights appear but the dating is usually accurate.

Theophanes's sources may have included summaries of important historical works rather than the originals themselves, a good many of which are still extant (e.g. Socrates's *Ecclesiastical History*, Malalas, Theophylaktos Simokattes, George of Pisidia, and others). The sources for the 7th century to 813 are less easy to trace, and this part of the book remains the most significant source for that period. A hypothetical Great Chronographer may have served as one of many sources for the historical works of both Theophanes and the patriarch Nikephoros (806–15). The period after 713 also appears to contain imperial, ecclesiastical and even military documents (iconoclast ones for the campaigns of Constantine V). Theophanes is surprisingly informed about affairs in the Caliphate and the east, but less so on western matters.

The *Chronographia* was compiled or written between 810 and 814. The most fascinating part is therefore the last section, from about 780 to 813. Theophanes seems at times to have included his own personal observations as well as records of oral sources (e.g. de Boor, 1998, p. 490). His negative picture of the emperor Nikephoros I has been interpreted by scholars as a reflection of a monkish resentment of the emperor's purported attack on the landed wealth of the rich and the Church and a sign of the author's resentment at the emperor's apparent toleration of iconoclasts. But far from representing a fanatical "monk's chronicle" for this period, Theophanes has left us with the only contemporary text expressing the bewilderment caused by the events surrounding the disastrous Bulgar war of Nikephoros I and the subsequent turmoil in Constantinople. In many respects, his account is the iconophile flip side of the reaction that restored iconoclasm in 815 precisely because of widespread dissatisfaction with the previous regimes.

The 9th-century translation of the *Chronographia* into Latin by the Roman scholar Anastasios is literal, and of great importance since it was made from a Greek manuscript earlier than any that now survive, the earliest of which comes from the late 9th century (Oxford, Bodleian Library, Wake 5). The *Chronographia* served as a major source for virtually all later Byzantine histories dealing with the period it covers, and a demoticizing Greek version exists in a post-Byzantine manuscript (Austrian National Library, Vienna, Vindob. Hist. gr. 76).

Biography

Born in Constantinople *c.*760 into a wealthy family, Theophanes was godson of Leo IV. He embarked on a career at the emperor's court and married well. But both Theophanes and his wife chose instead the monastic life. Theophanes founded the monastery of Megas Agros. Refusing to accept the restoration of iconoclasm in 815, he was exiled to Samothrace in 818, where he died in the same year. His chronicle, the *Chronographia*, covers the years 284–813.

Theophilos 812/13–842

Emperor

Born possibly at Amorium in 812 or 813 to Michael II and Thekla, the emperor Theophilos (829–42) was brought up in Constantinople. He was crowned co-emperor in the spring of 821 and succeeded his father in October 829 at the age of 16, but, in accordance with the latter's wishes, as co-emperor with his stepmother Euphrosyne, daughter of Constantine VI. After arranging his marriage through a bride show (if this is indeed a genuine historical event and not merely a rhetorical device) perhaps in May 830 (though possibly in 821) at which Theophilos chose Theodora, daughter of the late tourmarch (squadron commander) of Paphlagonia, Euphrosyne retired to a monastery of her own founding. After some years of poor health Theophilos died in Constantinople of dysentery on 20 January 842, leaving the crown to his 2-year-old son Michael and the empire in the hands of his wife and the logothete of the post (*logothetes tou dromou*, an officer in the imperial bodyguard), the eunuch Theoktistos.

In military affairs Theophilos's main task was to preserve the empire against Arab incursions. His efforts in Sicily and southern Italy were sporadic and hampered both by a lack of ships (a problem which he later took pains to remedy) and by the fact that the loss of Crete to expatriate Spanish Arabs shortly before his accession had created another hostile base for Muslim control of the seas. In Asia Minor he campaigned himself with personal bravery and no little success, but ultimately his destruction of Sozopetra provoked substantial Arab retaliation from the caliph Mutasim in 838. Theophilos was badly defeated, and nearly killed, in the ensuing Battle of Dazimon which opened the way to the Arab destruction of Amorium, a major blow since the city was the capital of the important theme of Anatolikon. Elsewhere Theophilos in 836 rescued from Bulgar rule Macedonian Byzantines who had been deported by Krum 25 years before to the area between the Danubian delta and the Dniester; and in 839 he built the fortress of Sarkel in the Crimea to protect his Khazar allies against the Rus. His military reorganization included the creation of further subdivision of the thematic *droungoi* (units) into *banda* (detachments), thereby improving control over his troops, and the establishment of the new themes of Cherson (in the Crimea), Paphlagonia, and Chaldia (both on the southern coast of the Black Sea) and the *kleisourai* (minor themes) of Charsianon, Cappadocia, and Seleuceia facing Arab-held territory to the east. He also increased the soldiers' pay and strengthened Byzantine forces by recruiting military detachments of Khurramite rebels (mainly Kurds) from what is now Azerbaijan, who converted to Christianity and served under their own leaders, and by forming a band of Ethiopian soldiers.

In domestic affairs Theophilos fully deserved his description by an anonymous historian of the first half of the 10th century as "a fiery lover of justice and a strict guardian of civil laws" (*Theophanes Continuatus*, 85. 1–2). He frequently demonstrated his willingness to punish even the most influential without favour, most notoriously by executing his father's accomplices in the assassination of Leo V (his godfather whom he seems to have admired and perhaps tried to imitate) and by having his brother-in-law Petronas publicly flogged for illegally building a palace that cut off the sunlight from a widow's house. An unfortunate tendency to assume guilt too hastily on insufficient evidence was partly compensated by contrite efforts at restitution, as is demonstrated by the elaborate plans to help Manuel, a former *strategos* (commander) of Asia, escape from the caliphate whither he had fled when slanderously accused by another official of treason. His reputation in this sphere persisted in Byzantium, since the anonymous 12th-century satirical *Timarion* presents Theophilos as a judge in the underworld together with the mythical Aeacus and Minos.

His highly developed social conscience, which won him considerable popularity, was publicly shown also in his weekly rides around Constantinople, when he checked the quality and prices of merchandise and heard petitions from the people. His fiscal policies were generally sound and the treasury consequently benefited considerably. Under his rule provincial economies began a slow recovery, profiting from both the establishment of regional mints and the issue of large quantities of *folleis*, the principal copper coins, a measure which contrasted with his predecessors' undue preoccupation with gold, and which was probably intended to facilitate daily shopping in the capital.

The principal domestic strife that disturbed his reign was occasioned by his increasingly enthusiastic promotion of iconoclasm, which had been pursued rather half-heartedly in recent years. He had probably been schooled in this by his former tutor, John the Grammarian, himself a convert to the cause. Despite, however, his religious convictions, his language suggests that his hostility to iconodules stemmed principally from the fact that they were breaking the law. The increasing zeal of his persecution (an initial policy of toleration has perhaps been overemphasized by historians) seems to have been exacerbated by attacks on him in iconodule pamphlets, but according to Eutychios, a Melkite patriarch of Alexandria writing in Arabic, it was ignited by his disgust at the charlatanry of a church administrator who, by means of a lead tube,

caused an image of the Virgin to lactate. Until the disastrous loss of Amorium he was encouraged in his policy by a remarkable coincidence of his military fortunes with the severity of his persecutions. The latter, nevertheless, continued and on occasion took bizarre forms, as when he ordered 12 iambic lines to be tattooed on the foreheads of two Palestinian brothers, Theodore and Theophanes (hence known as the "graptoi"), to advertise their propagation of heresy. During his reign he issued two iconoclastic edicts, one forbidding the manufacture and use of all sacred images, the other barring iconodule monks from public places and even their own monasteries. His religious problems penetrated his home life as well, for both his stepmother Euphrosyne and Theodora, the wife whom she had encouraged him to choose, were both iconodules (as was the only other known contestant at his bride show, the future poetess Kassia). In mid-839 he learned from Pulcheria, the youngest of his five daughters, that Euphrosyne was secretly teaching them to venerate icons by kissing "dolls" that she kept in a box. Nevertheless, Theodora permitted the restoration of icons in 843 only after fabricating the tale of her husband's recantation on his deathbed, whereby she saved him from condemnation. The posthumous rehabilitation of Theophilos, with the accretion of several fictitious tales, continued into the late 10th century, most notably in Theophanes Continuatus and the anonymous *De Theophili Imperatoris Absolutione* and *De Theophili Imperatoris Benefactis*.

Unlike his provincial and uncultured father, Theophilos was well educated, most notably by John the Grammarian. As emperor he encouraged learning and extended his patronage to three of the most influential scholars of his day, his former tutor, John, whom he elevated to the patriarchate in 837, John's cousin (or nephew) Leo the Mathematician, and the future patriarch Methodios I, whom he released from the imprisonment imposed upon him by Michael II and brought to court, though apparently not trusting him completely because of his iconodule position. Theophilos himself delighted in intellectual conversation and wrote hymns that were sung in Hagia Sophia. His artistic interests extended to architecture, for he was not only responsible for the restoration of the capital's sea walls and a hospital but was also by far the most influential figure in the development of the Great Palace. His additions there included a small but refined residence for himself (the "Pearl"), which was adorned with mosaics and was perhaps constructed for his bride show, and later some adjoining domestic buildings (one of which probably included a nursery for his children), a palace for his daughters ("Karianos"), business and ceremonial halls (the "Triconch" and "Sigma"), which were splendidly decorated with marble inlays, a chapel, and a large courtyard adorned with elaborate fountains. His beautification of other more public buildings within the complex was further enhanced by the making of two huge golden organs, a golden plane tree with golden birds, and two golden lions which chirped and roared respectively in rivalry with similar technological marvels in Baghdad. At Bryas on the Asiatic shore of the Sea of Marmara he built a new palace which, with the exception of a church and a chapel, was entirely Arab in style.

Theophilos's faults were due mainly to an excess of zeal, but his energy, his willingness to learn from his mistakes, and his warm personality, well exemplified by his loyalty to and fondness for both his old tutor and his iconodule stepmother, suggest that but for a premature death his could have been a truly memorable reign. At the very least it provided or consolidated the bases for the economic, military, and cultural successes of the Macedonian dynasty which were soon to follow.

Theophrastus *c.*371–*c.*287 BC

Philosopher

Theophrastus succeeded Aristotle as the head of the Lyceum in Athens. More than 200 works are attributed to him. Allowing for duplications because of confused titles and some works that are excerpted from larger ones, the volume of his writings spanning numerous subjects is enormous. Diogenes Laertius wrote Theophrastus' biography and related the testimony of numerous later authors who preserved quotations from lost works. Only a few of his works survived intact. Theophrastus' influence is measured in differing ways: the accomplishments of his students; the indirect influence through intermediary writers who summarized his ideas; the knowledge in his scientific works on mineralogy and botany; and his writings on philosophy and religion.

Among the 2,000 students taught by Theophrastus were Strato of Lampsacus (physics), Erasistratus (physiology), Demetrius of Phalerum (librarian at Alexandria), and Arcesilaus (philosophy). In the turmoil of Athens in the 320s and 310s BC, the works of Aristotle and Theophrastus did not circulate widely. In the arrangement of Aristotle's works by Andronicus of Rhodes (*c.*70 BC), some of Aristotle's writings may have been confused with Theophrastus' in what is now called the *Corpus Peripateticum*. At the very least, during the Middle Ages a number of small works and fragments of

larger works circulated under Theophrastus' name, some of which are not now regarded as genuine. Conversely some works attributed to Aristotle (e.g. *On Colours* and *On Sounds*) were probably written by one or more of Aristotle's or Theophrastus' students or by Theophrastus himself.

While accepting most of Aristotle's ideas, Theophrastus broke with his mentor in a number of ways important in later Hellenistic, Islamic, and Christian theology and natural philosophy. He challenged Aristotle's notion that to all things nature imparted a final cause, a direction towards which action takes place. Theophrastus said that nature does many things "at random" and that there is no discernible purpose for such things as the tides, breasts on men, and horns on deer. He also raised doubts about fire as an element: it alone generates and destroys itself; there are numerous ways in which it is born; it requires a substratum (something to burn); thereby, it cannot exist by itself. On motion, Theophrastus questioned why, if there was one mover (*primum mobile*), all heavenly bodies did not have similar motions; if such bodies have a desire for circular motion, does that not imply a soul in them?

Theophrastus' major surviving works now regarded as genuine are: the *Enquiry into* Plants (*Historia Plantarum*, 9 books: morphology, classification, habitats, uses including medicinal); *Plant Explanations* (6 books: generation, propagation, environmental factors including cultivation, seeds, degeneration, juices); *Minerals* (2 books: formation and differences among minerals and stones such as by visual and tactile qualties); *Metaphysics* (1 book which questioned some of Aristotle's ideas but was published in Aristotle's works); *Characters* (1 book: 30 profiles of personality types); and short works: *Odours*, *Meteorology* (preserved only in Syriac and Arabic), and *Senses* (in manuscript with Aristotle's treatises).

Theophrastus' importance is perhaps greater because of his influence on other writers than because of the direct knowledge from his surviving treatises. Some patristic writers knew him and, especially, Jerome quoted Theophrastus' work on *Marriage*, but he disapproved of Theophrastus' negative opinion, and Chaucer's Wife of Bath agreed with Jerome. Strangely, Theophrastus was less influential on Byzantine writers than on those in Arabic and later Latin. Eustathios referred to *Characters* and Michael of Ephesus knew of several of his works. Cicero said that Theophrastus placed more emphasis than Aristotle on the importance of fortune and wordly goods. Arabic writers knew of Theophrastus' philosophy and discourses on botany and minerals. In the west Theophrastus' works on minerals had indirect influence on lapidaries. The biggest impact came in the 15th and 16th centuries when a rediscovery of Theophrastus began with Lupus Castilliunculus's translation of *Characters* (*c.*1430s) and Theodore Gaza's rendering of the botanical works (1453/54). The fields of botany (including pharmaceutical uses) and minerals were the centres of Theophrastus' considerable impact on the Latin Renaissance. Appropriately the first printed edition, by Aldine (Venice, 1497) combined both Aristotle's and Theophrastus' works.

Theopompus 378/77–*c.*320 BC

Historian

Theopompus of Chios, son of Damasistratus, was one of the most important historians and public men in the years leading up to and including the reigns of Philip of Macedon and Alexander the Great. Not much is known for certain about his life. Photios (9th century AD) wrote a detailed biography (*Bibliotheca*, 176 = T2): he was exiled from Chios with his father; he later returned, thanks to a letter written by Alexander to the Chians; on the death of Alexander he fled to Egypt, where Ptolemy I Soter almost had him killed. While some of these details may be doubted, he did in fact write letters to Alexander, and Alexander did restore exiles to Chios.

Although there are good reasons for doubting it, Theopompus is widely credited with being one of the pioneers of "oratorical" or "tragic history", in part due to the alleged influence of the Athenian rhetorician Isocrates whose student he was later thought to have been. Certainly for his Roman readers he was thought of as a combination of historian and orator. In the Byzantine period his writing was known chiefly by lexicographers and grammarians, arising from the fact that he was not a canonical author. His work survives to us only in the form of later paraphrase and quotation (F. Jacoby, *Fragmente der griechischen Historiker*, 115).

According to ancient testimonia, Theopompus was the author of a number of historical works and minor treatises: the *Epitome of Herodotus*, *Hellenica*, and *Philippica* on the one hand, and *On the Funds Plundered from Delphi*, *Against the Teaching of Plato*, and encomia of both Philip and Alexander on the other. Given the propensity in antiquity to epitomize works and then view those epitomes as different productions from the material from which they came, it is probable that Theopompus did not in fact write all of the above works. Far and away his most important contributions were the *Hellenica* and *Philippica*.

According to Marcellinus' biography of Thucydides (chapter 45), both Xenophon and Theopompus completed their great predecessor's history of the Peloponnesian War, which breaks off in the year 411 BC: in both cases, these works were entitled *Hellenica* or *Greek Affairs*. However, unlike Xenophon's text, which reports events down to 362 BC (the second Battle of Mantinea), Theopompus took his narrative down only to the year 394 BC (the Battle of Cnidus). A claim by Porphyry that Theopompus plagiarized a portion of Xenophon's history in his own work places its composition in the late 350s BC. A papyrus published in 1908 and subsequently called the *Hellenica Oxyrhynchia* was thought by some to be Theopompus' *Hellenica*, though this claim has not won general acceptance. The two fragments of any real substance that survive from the *Hellenica* deal with the moral characters of the Spartan leaders Lysander and Agesilaus, in the same spirit as much of what survives from the *Philippica*.

The *Philippica* treated events between Philip II's assumption of the Macedonian throne in 359 BC and his death in 336 BC; it comprised 58 books, and must have been massive in scale. As the title suggests, it is an account of Greek history understood as unified by the activities of Philip; according to Polybius (2nd century BC), Theopompus chose to organize his text around Philip because "Europe had never before produced such a man as Philip, son of Amyntas" (8. 11. 1 = fr. 27). While Theopompus recognized the king's importance for shaping the events of his age, he did not take a positive stance towards him. Indeed, quite the contrary: Philip is simultaneously a corrupting force in the Hellenic world, and his victory over the Greeks is proof of their decadence. Theopompus frequently engages in an analysis and evaluation of the characters of men and states, and he is especially interested in the detrimental effects of luxury: so, for example, famous Athenian statesmen are criticized for their personal failings (frr. 97, 99), and whole populations such as the Ardiaeans (fr. 40) and the inhabitants of Byzantium (fr. 62) are singled out for scorching moral censure. Some of Theopompus' criticisms stem from personal bias as well as a dislike for democratic institutions. He can also offer positive evaluations of character: the portraits of Lysander and Agesilaus from his *Hellenica* are good examples.

With the exception of a few Hellenistic historians who were also interested in the question of moral decay and luxury (Timaeus, 4th–3rd centuries BC; Duris of Samos, 4th–3rd centuries BC; Phylarchus, 3rd century BC), Theopompus' influence on subsequent historiography was not great. However, ancient readers were broadly familiar with his work. Critics such as Dionysius of Halicarnassus, Cornelius Nepos, and Lucian all point to Theopompus' acerbity and censorious stance: he is, as Nepos describes him, "maledicentissimus" – the most abusive writer.

Theopompus' work was known in some form by late anti-Atticist writers and lexicographers. Several of his fragments are taken from Stephanus of Byzantium (6th century AD); and, as noted above, the patriarch Photios provides an important biographical notice, as well as fragments of his work. Krumbacher (*Geschichte der byzantinischen Literatur*, 1. 232) adduces Theopompus as a precedent for the court historian Procopius of Caesarea (5th–6th centuries AD), but does not claim any direct influence.

JOHN DILLERY

Biography

Born in Chios in 378/77 BC, Theopompus was exiled from Chios with his father for sympathizing with Sparta. Allowed back by Alexander the Great in 333/32, he was exiled again on Alexander's death and fled to the court of Ptolemy I Soter. According to tradition he was a pupil of Isocrates and worked as an orator. In addition to various speeches and treatises, his principal works were historical: *Epitome of Herodotus*, *Hellenica*, and *Philippica*. He died *c.*320 BC.

Theotokis, George 1844–1916

Politician

Few Greeks today recall the name of George Theotokis, prime minister of Greece four times between 1899 and 1909. Unlike his predecessor Trikoupis, the ardent reformer, and his successor, Venizelos, the unmatched diplomat, Theotokis was a moderate politician but by no means mediocre. He was not a passionate man (at least not passionate for power) but he had

sophistication and natural nobility. He was descended from the Byzantine family of Theotokis who had eventually settled in Venetian-held Corfu. In the 16th century they were registered in the Venetian *Libro d'Oro*. In the following centuries several members of the Theotokis family distinguished themselves in the humanities and sciences, the most famous being Nikiphoros Theotokis, an 18th-century representative of the Greek Enlightenment.

George Theotokis was the grandson of John-Baptist, the Greek minister of justice in 1824, a man of religion, strongly anti-British, and a keen supporter of king Otho. He was the son of Nikolaos, a low-profile judge at the Court of Appeals of the Ionian islands, a landowner of average income. There is evidence that the influence exercised by John-Baptist's ideas about God, king, and country on the young George was even stronger than his own extravagant life and law studies in Paris, where he received his baccalaureate in 1863 and eventually his doctorate in 1868.

In mid-19th-century Greece all men educated in Europe were expected to play a role in politics and Theotokis was no exception. Local society in Corfu was experiencing a difficult transitional period from a British colony into a Greek province tormented by social controversies and little respected for its lost nobility. Having failed to enter parliament in 1873 and 1874, Theotokis was elected mayor twice (1879 and 1883) and contributed much to Corfu's infrastructure. Better roads, gas lighting, the demolition of the city walls, and the installation of sewage works restored the lost European glamour of Corfu and secured for Theotokis an easy election to parliament (April 1885) as a deputy of the Trikoupis party.

A year later, when Deliyannis's government resigned, Trikoupis, the new premier, appointed Theotokis minister for the navy, to implement the armament programme he had launched five years earlier. At a period when the Greek nation's most fervent desire was to free Crete from the Turks and Macedonia from Bulgarian infiltration Theotokis was justified in devoting most of his efforts to bargaining for three French-built cruisers and introducing measures for the better training of the crews. In early 1889 he was also assigned the Ministry of Education and Religious Affairs, but under constant pressure from the opposition he did not manage to introduce any legislative measures at all.

Trikoupis remained in opposition from 1889 to 1892. When he resumed office, he appointed Theotokis his minister of the interior. He was then assigned (1893) the mission to contract a new British loan, which was expected to save the government and prevent the country's bankruptcy. The tough terms demanded by London bankers were eventually accepted by the premier but declined by king George I in May 1893 under heavy pressure from the opposition. In 1894 Greece's bankruptcy was officially announced. Theotokis was among the few of Trikoupis's deputies who survived the electoral disaster of 1895.

Bankruptcy was followed by the Cretan revolution in 1896 and the gradual involvement of the National Society (*Ethniki Hetaireia*) in Greek military and political affairs, encouraging a war against Turkey. Theotokis tried to strike a balance between war and peace. He criticized the government for its lack of determination and approved the dispatch of Greek troops to Crete in 1897; but he also suggested that encounters at the Thessalian border should be avoided. He refrained from siding with the National Society "hot-shots", as he called them, but when, amid Greek military disaster and humiliation, he was again appointed minister of interior of the short-lived Dimitrios Rallis government (April–September 1897), he failed to bring about the Society's dissolution. In November 1898 he was elected head of the Trikoupis party and in February 1899 he won the elections. In early April Theotokis became prime minister, an office he held until November 1901 and three more times in the following years: 14–28 June 1903, December 1903–December 1904, and December 1905–July 1909.

At the turn of the century the Eastern Question was entering its last stage and Greece was approaching the climax of irredentism. Armaments were again the chief priority if the disaster of 1897 was not to be repeated. Under pressure from the opposition and the army Theotokis eventually succeeded in passing and implementing a series of laws providing for the reorganization of the General Staff, the reserve officers' training, mobilization plans, and military medical services. He also ensured the purchase of modern rifles and artillery, and a significant increase of both serving and reserve forces. His choices were justified by the Greek victories in the Balkan Wars of 1912–13.

Meanwhile foreign policy required caution. Theotokis was known for his "blameless position" (*apsogos stasis*) towards Turkey but in fact he had few options. Alienated from Russia, the patron of Bulgaria, rejected more than once by Britain and France, which supported Ottoman integrity, he occasionally sided with Germany, Turkey, and Romania in order to protect Greek interests in Macedonia. But, on the other hand, he provided diplomatic and financial support for the Greek bands to counterattack Bulgarians and Romanians. He also tried (in vain) to play the Turks and the Great Powers against each other during several crises over Crete, Macedonia, and Samos.

In domestic affairs his achievements were inferior to his intentions and abilities. He contributed in particular to administrative decentralization, tramway and railway communications, and Athens' infrastructure; he established a bank for raisin producers and a fund for retired seamen. He might have done even more had more of his laws been approved by parliament. But like most premiers of his time, Theotokis had just as many problems with keeping his party together as with defending his policy against the opposition. Certainly he was most unwilling to exert pressure in order to prolong his tenure of office; and he gave in rather easily to the pressure of the Church, to social riots, the raisin producers, the guilds, and army officers, resigning with dignity because he was a man of honour, loyal to his king, but not a conservative by conviction.

Theotokis was in favour of the king's interference in foreign policy but not at any cost. When he was called to ministerial office again in 1915, he advised king Constantine to no avail not to defy Venizelos's majority in parliament. He was elected deputy for the last time in December 1915 but did not enjoy an easy comeback. He died in January 1916 worrying over the disasters looming on the horizon, which eventually came in the form of a national schism, the Asia Minor catastrophe, and the execution in 1922 of his own son, Nikolas Theotokis, after the famous "trial of the six" (the scapegoating of prominent anti-Venizelists following the Asia Minor Catastrophe). It was in fact his grandson, another Greek premier, George Rallis

(1980–81), who pointed to Theotokis's mildness as his chief contribution to Greece's public affairs. If that was the case, then his chances of qualifying for the Greek national pantheon, crowded with passionate heroes, were very slim indeed.

BASIL C. GOUNARIS

Biography

Born in Corfu in 1844, the grandson of a minister of justice and the son of a judge, Theotokis was educated in Paris. Twice mayor of Corfu, he was elected to parliament in 1885 as a deputy of the Trikoupis party and became a minister in 1886. He was prime minister four times between 1899 and 1909. He was elected to parliament again in 1915 but died in January 1916.

Theotokis, Nikiphoros 1731–1800

Scientist and theologian

Nikiphoros (baptized Nikolaos) Theotokis was one of the brightest scholars of the modern Greek Enlightenment. His multidimensional contribution classifies him as one of the pioneering representatives of modern Greek scholasticism who during the century before independence battled against ignorance and superstition to develop a national conscience within the Greek population of the Balkans and Asia Minor.

According to the official record in the *Libro d' Oro*, Nikiphoros was born in Corfu on 15 February 1731. He studied initially in his own country under Jeremia Kavvadias, who also taught during the same period the other great Corfiot scholar, Evgenios Voulgaris. Kavvadias's overpowering personality steered the young student towards the Church, so in 1748 at the age of 17 – in spite of objections from his family and various bureaucratic obstacles – he was ordained a deacon. But since he was not allowed to practise his religious duties until he came of age and since he had completed his basic studies, Theotokis travelled to Italy around 1749 – which was then the centre of studies for the majority of Greeks who wanted to enrich their knowledge – where he studied philosophy, physics, and mathematics at the universities of Bologna and Padua. Here the teachings of modern physical theories already prevailed, theories that questioned Aristotelian authority.

Even though his attendance at the University of Padua has been questioned, reports by Theotokis himself as well as the scientific content of his work verify the fact that he actually did study at Padua under Giovanni Poleni. Poleni, a pioneering leader of the scientific reformist movement in Italian universities, also taught other significant scholars of the first period of Greek Enlightenment, such as Voulgaris, Josephos Moisiodax, and Zerzoulis, scholars who generally supported the introduction of modern scientific thought into the wider Balkan region. The young Theotokis was especially impressed by the value of experiments in the sciences and this can be seen in his books. At the same time he acquired an adequate knowledge of higher mathematics, a knowledge that was among the best for a Greek of that period. His biographers mention that he also studied medicine and E. Sarafidis tells us that Theotokis practised medicine in Jassy in 1775.

He returned to Corfu after three years of studies and at his own expense founded an educational centre where he taught philosophy, mathematics, and physics, while his former teacher Kavvadias taught all other subjects. During this period, vice-admiral Iakovos Nanis of the Venetian navy asked Theotokis for his advice concerning the repair work being carried out at the port of Gouvion. Nanis accepted and recognized his scientific knowledge – especially in hydraulics – since Poleni (Theotokis's teacher) was considered then to be one of the greatest experts in Europe in these matters.

In conjunction with the founding of his educational centre, Theotokis was appointed a priest at the church of Sts John the Baptist and Paraskevi in 1758 and for the next three years he delivered inspiring Christian sermons.

During this period Theotokis received an invitation from patriarch Ioannikios to assume the management of the academy on Mount Athos, which had been closed since 1761 when Voulgaris had left it. But objections were raised on the Holy Mountain to his assumption of these duties.

Theotokis therefore travelled to Constantinople where he developed close ties with Grigorios Gikas, a leading person among the aristocracy of Constantinople. It should be noted that during his stay in Constantinople Theotokis replaced Voulgaris as head of the patriarchal school but, since he worked in a climate that negated progressive thought, he soon came into conflict with the conservative Phanariot groups. Theotokis eventually resigned after clashing with the patriarch himself. When Gikas assumed the throne of Moldavia, he invited Theotokis to head the academy at Jassy and to teach mathematics, physics, and geography. In 1765 Moisiodax succeeded Theotokis as head of the academy and the latter travelled to Leipzig where after a number of years he published the first volume of his work *Stichia Physikis* (Elements of Physics), which even today is considered to be a milestone for science in Greece. At the same time, he was being systematically informed about all recent scientific developments. His activities soon became known to other European scientists and their respect is confirmed by the fact that J.J. Reisck dedicated the eighth volume of his work *Analekta ton Ellinon Ritoron* (Outstanding Greek Orators, Leipzig, 1773) to Theotokis.

In 1772 he persistently refused the archbishopric of Philadelphia in Venice since he did not want anything to do with the Catholic Church. Returning to Jassy in 1773, Theotokis assumed the directorship of the academy (a three-form school for children aged 10–13), teaching there until 1776 and thus contributing to the introduction of modern scientific theories to the principalities along the Danube. He travelled to Russia at the end of 1776 at the invitation of Voulgaris. When Voulgaris resigned, Theotokis was ordained archbishop of Cherson on 6 August 1779, and later assumed the archbishopric of Stavroupolis, which he resigned in 1792 after clashing with Potemkin. Theotokis lived in the monastery of St Daniel in Moscow until his death on 31 May 1800. Evidence of his pastoral work in Russia includes the conversion of a good many Muslim Tartars to Orthodoxy.

His published work may be classified under two main headings: ecclesiastical and scientific. With regard to the first, Theotokis was one of the clerics who made Christian doctrine

more easily understood by the people. His most valuable book on that subject was *Kyriakodromion* (Sunday Cycle, Moscow, 1796), in which he tried to explain New Testament passages by means of the interpretation and annotations of the early Church Fathers. He also wrote sermons, a guide to the ascetic life, and a treatise on the conversion of the Jews. With regard to the second, Theotokis the scientist showed a restless and investigative spirit and had a complete understanding of the Hellenic Enlightenment of which it would not be an exaggeration to consider him a co-founder.

Theotokopoulos, Domenikos (El Greco) *c.*1541–1614

Painter

Domenikos Theotokopoulos, usually known as El Greco ("the Greek"), was one of the most original and innovative painters of 16th-century Europe. The curiously elongated figures that people his later compositions are instantly recognizable, as are the brilliant and contrasting colours in which he clothes and surrounds them. So unusual are his portrayals of the human figure that they have even been attributed to mental illness or to the distorted vision caused by astigmatism. In the same way, so unique is his style of painting that no consensus has emerged on exactly how to categorize it. He has been described as a member of the Castilian school, as a follower of the Venetian master Titian, and as a representative of the fervour of the Counter-Reformation. Yet, while each of these categories may have some claim to authenticity, the origins of El Greco's art lie in the Byzantine tradition and in the Cretan school of icon painting.

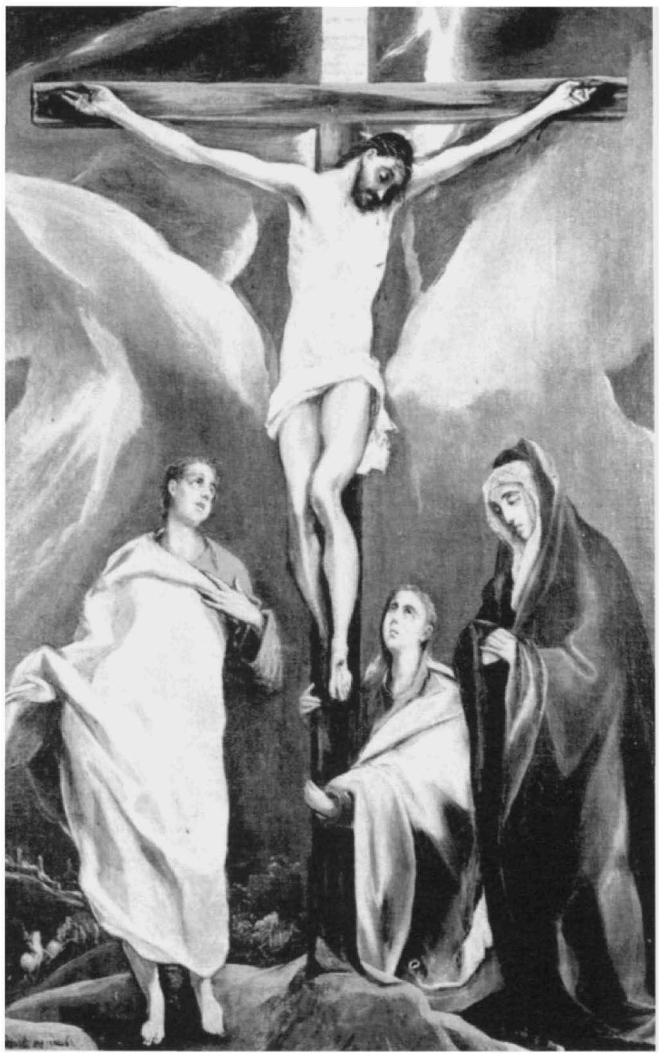
Like another famous representative of that school, Theophanes of Crete, El Greco was a native of Candia, the modern Herakleion, on Crete. His family were Roman Catholics and a number of his relatives worked as officials in the service of the Venetian government of the island. It used to be thought that he had trained under Titian in Venice, but it is now clear from documentary evidence that he had learnt his trade long before he left Crete. One document dated 1563 describes him as a master painter, and evidence of the value placed on his work as early as 1566 is given by another which prices one of his paintings at the considerable sum of 70 ducats. A number of works from this early period have now been identified. They include a signed *Dormition of the Virgin*, painted in about 1567, in the church of the Koimesis on Syros, and an *Adoration of the Magi*, now in the Benaki Museum in Athens. Both works are in the post-Byzantine style, although Italian influence is already noticeable in the mobility and corporeality of the figures.

Had El Greco remained on Crete, he might perhaps have continued to work in this unremarkable style, but in about 1568 he left the island, never to return. He went first to Venice, where he seems to have had some contact with Titian. By the end of 1570 he had moved on to Rome, where he operated a workshop for some years. He left Italy altogether in 1577 and moved to Spain, first to Madrid and then to Toledo, where he remained for the rest of his life.

The move westwards was accompanied by a profound change in El Greco's style, transforming him into a fundamentally Western painter. The change is plain to see in the public commissions that he carried out during his early years at Toledo, such as his *Disrobing of Christ* (1577–79) in the cathedral sacristy, and his famous *Burial of the Count of Orgaz* (1586–88) in the church of Santo Tomé. As his fame as a painter spread, his workshop produced scores of religious paintings for private clients and he was unanimously acclaimed by his contemporaries as a portraitist. His portraits tend to be austere in tone and usually on a neutral background, but they show an ability to convey character and physique. Perhaps the best known is the full-length depiction of the bespectacled inquisitor, cardinal Fernando Niño de Guevara, in his red robes and biretta, now in the Metropolitan Museum of Art, New York. A number of self-portraits also survive.

His later work became increasingly impressionistic, as he adopted an ever freer style. In the *Immaculate Conception* of 1607–13, in the Museo de Santa Cruz, Toledo, the Virgin floats upwards, supported by spindly angels. The *Adoration of the Shepherds*, painted in 1612–14 for his own burial chapel in Toledo, displays vivid, dissonant colours and distorted physical shapes. These compositions puzzled contemporaries and were regarded as eccentric, but they were to be a powerful influence on painters of the early 20th century.

Yet, in spite of his move to Spain and the radical development of his painting style, El Greco did not lose touch with his Greek origins. He tended to associate mainly with the Greek community in Toledo, and had little to do with local Spanish life. He continued to sign his paintings in Greek, and on a



Domenikos Theotokopoulos: *The Crucifixion* (1600–1605), National Gallery, Athens

number of occasions came forward to support his fellow Greeks when they were involved in cases in Spanish law courts.

It is therefore not surprising that elements of Byzantine iconography still occur in his later work. His depictions of Mount Sinai, painted in the 1570s, contain the same angels, tombs, and camels, in the same places, as a treatment of the same subject painted in traditional style in Thessalonica around the same time. The *Disrobing of Christ* in Toledo Cathedral preserves some Byzantine feeling in the superimposition of the heads of the figures in the background to the main scene. Other works display not so much elements from Byzantine imagery as a mystic vision, similar to that of icons venerated in the Orthodox Church. His *Christ as Saviour of the World*, in the National Gallery of Scotland, Edinburgh, exemplifies this tendency. The figure of Christ is placed in no definite time or space, in stark frontality, with light and dark colours used to enhance the effect. It would, of course, be easy to make too much of these Graeco-Byzantine influences in El Greco's work, and David Talbot Rice was surely exaggerating when he described the painter as "the last of the Byzantines". Nevertheless, such influences remained an aspect of his work, up to the very end of his life.

Thus El Greco's idiosyncratic style should not be seen as the product of any particular school, Byzantine or Western, any more than it should be dismissed as the result of madness or myopia. Rather it grew out of his physical and artistic journey westward: the fusion of Greek, Italian, and Spanish influences with his own unique creativity and genius.

Thessalonica

City in Macedonia

Thessalonica is the second largest city of Greece, with a population of 750,000 according to the census of 1991. Founded by decree in 316 BC by Cassander, who subsequently became king of Macedonia, the city was named after his wife Thessalonica, half-sister of Alexander the Great. It comprised 26 older towns and hamlets of the region, whose inhabitants were encouraged to resettle at the new location. Some of these towns survived the foundation of Thessalonica, while others disappeared entirely. Thessalonica was to serve as the harbour of Pella, the Macedonian royal capital, which had become landlocked as a result of the sedimentation deposited by the four large rivers of western and central Macedonia. The city plan followed the Hippodamian system applied to contemporary cities, a grid of streets at right angles to each other. Despite its long and turbulent history since the Hellenistic era, through periods of great

Thessalonica: the Rotonda of Galerius, late 3rd century AD

prosperity and times of hardship and instability, Thessalonica has preserved the main features of the original orthogonal layout, corrupted in times of overcrowding. Furthermore, the walls, which have defended Thessalonica since late antiquity, defined an area of 330 hectares, which – with some alterations mainly on the eastern side – became the confines within which the city developed until its expansion after the mid-19th century.

Owing to its geographical position Thessalonica prospered as a centre of commerce and industry and was already a wealthy city when the Romans conquered Macedonia in 168 BC after the battle of Pydna. Its inhabitants remained loyal to the imperial party during the civil wars that followed the assassination of Julius Caesar in 44 BC. Under the Romans Thessalonica acquired an additional military importance, since it often hosted army units on their way to defend the empire against enemies in the east or against hostile tribes of migrating peoples from the north. Indeed, the very routes that carried trade, ideas, and wealth in times of stability were to bring raids, armies, and violence in times of instability, both on a large scale, as the Pax Romana, the lengthy period of peace inaugurated and secured by the Romans, was drawing to an end in the mid-3rd century AD.

The Romans provided the city with public works. Many public buildings came down in the earthquake that shook the city in AD 620 and their materials were either reused in Byzantine constructions or served as landfill. By contrast, however, a small number of Roman public works outlasted the Roman era, most notably the Via Egnatia, the road constructed by the vice-consul Gnaeus Egnatius in the 2nd century BC to connect the Adriatic coast to the eastern regions of the Roman empire. The main highway, which branched off the Via Egnatia and ran across the city from west to east, was named Via Regia in antiquity, Leoforos in Byzantine times, Broad Street under the Ottomans, and Egnatia today.

At the end of the 3rd century AD Thessalonica became the residence of the tetrarch, or quarter-emperor, Galerius, who constructed a palace, a triumphal arch to commemorate his victories against the Persians, a hippodrome, and a round building, the Rotonda, whose original use is still an issue of debate among scholars. It is the oldest surviving building in continuous use in the Balkans, was converted to a Christian church, then to a mosque in 1591 by the Ottomans. In 320 emperor Constantine replaced the ancient harbour at the southeast end of the wall with an artifical harbour at the western end of the city limits. This harbour served the city during the Byzantine era. Even after it had fallen out of use, the harbour has remained in the same area.

Among the foreigners who had settled in the ancient city, probably since pre-Roman times, was a community of Jews. They retained their religion but became linguistically assimilated and later became known as Romaniot Jews. It was among this early Jewish community of Thessalonica that St Paul preached his new faith when he visited the city in AD 40. He then kept contact with his Jewish and Gentile converts through his letters to the Thessalonians.

Christianity became important as a force of ideological cohesion in the subsequent history of the city, which gradually assumed a truly Christian character during the 4th century. The focus of this new identity was the cult of St Demetrius, a young Roman officer, who had died for his faith in 305. The new cult was a Christian substitute for the older mystic cult of the Cabiri brother-gods, who, like their Christian counterpart, had also been the city's patrons. The first church to St Demetrius was built on the site of the Cabiri shrine in the 5th century. It burned down after the earthquake of 620, was rebuilt, then became a mosque in 1491, and was reconverted to a Christian church when Thessalonica became Greek again in 1912. It burned a second time in the great fire of 1917 and was rebuilt once more.

Throughout the 6th century the Avars and Slavs raided the environs and besieged the city. They never succeeded in capturing Thessalonica, but drove large numbers of the rural population inside its walls. After the emperor Justinian II put an end to these attacks at the end of the 7th century prosperity returned, while peaceful exchanges began with the Slavic settlers in the area. The church of St Sophia was constructed during this period. In the 9th century the monks Cyril and Methodios set off from Thessalonica to convert the Slavs to Christianity and introduce literacy by creating a suitable alphabet.

In 904 the Saracen Arabs from their pirate state in Crete, which thrived on plunder, piracy, and the slave trade, attacked and sacked the city, and killed and captured its inhabitants, carrying them off to be sold as slaves. John Kameniatis, who was among the captives, wrote a gruelling account of the incident.

Thessalonica withstood the clash between the Byzantine empire and the Bulgarian state in the 10th century, but had once more to take in large numbers of destitute peasants. In 1185, however, it fell into the hands of the Normans from Sicily, who sacked it, killed and plundered, held it for a year, and then left. When the city fell to the Latin crusaders in 1204, after the sack of Constantinople, the city elders negotiated their surrender and were thus able to retain some of their traditional rights of self-government. The Byzantines recaptured the city 20 years later, while the imperial capital was restored to Byzantine rule in 1261.

The empire was weak and fragmented. Nevertheless, Thessalonica experienced its last period of greatness: the Palaiologan renaissance of the 14th century. Profiting from the overall economic decline of the state, the Venetians had expanded their commercial business, acquired trading privileges, and settled in Thessalonica, thus contributing to intense economic activity and prosperity to the benefit of the arts. Several of the surviving Byzantine churches with their paintings and mosaics (Holy Apostles and St Catherine) date from that period and illustrate the artistic achievements of the Macedonian school of architecture and painting.

During this period of social cleavage, economic inequity, civil war, and foreign attacks, some scholars found new values in Classical Greek literature, began to speak of justice and freedom, and chose a western political and philosophical orientation. By contrast, their opponents developed the mystical movement of hesychasm of eastern inspiration, which became attractive to the wealthy and the nobility. They

Thessalonica: illustration from the 11th-century chronicle of Skylitzes showing the Thessalonians repelling a Bulgar siege in the 10th century, Biblioteca Nacional, Madrid

supported the pretender to the Byzantine throne, John Kantakouzenos. The middle classes and the poor took the opposing side in the ideological controversy, that of the Zealots, and supported the legitimate heir to the throne, John V Palaiologos. In 1342 they rebelled, assumed control of the city, held it for seven years, and established a republic, confiscating the estates of the Church and of the nobility.

Throughout this period the neighbouring Serbs, Bulgarians, and Turks were also drawn into the conflict. Finally, in 1387, Thessalonica surrendered to the Ottoman Turks; in exchange for tribute to sultan Murad I it retained some of its communal privileges – as it turned out, only in name. The city returned to Byzantine rule for a short while until, in 1423, unable to defend itself against the Turks, it voluntarily capitulated to the Venetians. In 1430, after a long siege that left Thessalonica virtually depopulated and defenceless, the second largest city of the empire fell unconditionally to the Ottomans under sultan Murad II and was incorporated into his private domain.

The Ottomans established a military guard of Janissaries and proceeded immediately to resettle the city. The great population influx, however, occurred two generations after the fall of Thessalonica, in 1492, when the Ottoman sultan Bayazid II welcomed the Sephardic Jews expelled from Spain by king Ferdinand and queen Isabella. Approximately 20,000 of them settled in Thessalonica, which became a predominantly Jewish city and began to thrive once again in trade and industry. Until the beginning of the 19th century the relative proportions of the three main ethnic groups were approximately half Jews and, of the remaining half, slightly more Turks than Greeks. The principal occupation of the Jews of Thessalonica was connected with the production and trade of woollen textiles for military uniforms. Thanks to its importance for the army their community acquired the monopoly in this field, in exchange, however, for the economic protection of the Janissaries. The heyday of the Jewish community of Thessalonica was the 16th century. Thereafter, with the decline of Venice as the Mediterranean trade lost its international importance in favour of the Atlantic routes, the Jews in Thessalonica entered a period of crisis, accompanied by a serious rift when, in the 1660s, large numbers converted to Islam and became known as "Dönme".

New circumstances in the 18th century proved favourable for the rise of the Greek community of Thessalonica, when French merchants settled in the city to trade in grain, wool,

cotton, and hides from the Macedonian hinterland, and were followed by other European nationals. However, as a consequence of the Greek national uprising of 1821 the Greeks of Thessalonica suffered atrocities at the hands of the Turks and their community entered a period of decline. Furthermore, the destruction of the Janissaries as a result of the reforming efforts of sultan Mahmud II in 1826 disrupted the overall economy of the city, which had been in Janissary hands to a great extent.

Although there was no institutionalized segregation, each ethnic group lived in a more or less distinct neighbourhood, whose boundaries varied over the years. The Turks lived mostly in the higher section of the city in large and more hygienic housing. The Greeks lived lower down and towards the eastern parts of the city in smaller houses, while the Jews lived in the city centre and closer to the harbour and the marketplace in confined, occasionally overcrowded conditions, in narrow streets, more exposed to the hazards of epidemics and fire. Each group was governed by a communal body of elders with legal jurisdiction led by its religious head.

A new age of prosperity came to Thessalonica after the mid-19th century with the age of steam, accompanied by a great interest among the European powers in the economic and political reforms of the Ottoman empire. The Greeks had profited from the support of the Greek kingdom and they as well as the other nationalities from the benefits of secular education, economic progress, and modern banking. The affluent members of all ethnic groups were acquiring larger houses beyond the city walls, which the enlightened regional authorities began to pull down, since they no longer served the city's defence. Construction of a railway line from Thessalonica to Mitrovica began in 1871 and, as a result of new transportation requirements, the harbour had to be modernized. Public works began on a large scale. However, in 1890 an extensive fire burned down a large section of the town centre, which was redesigned and rationalized.

Thessalonica was liberated by the Greek army on 26 October 1912, at the beginning of the First Balkan War. During World War I it became the quarters of large numbers of Entente army units and the temporary seat of the pro-Entente Greek government of Eleftherios Venizelos in 1916. In August 1917 the last major fire destroyed the centre of the city and left approximately 15,000 families homeless. A new town plan was devised by the French city planner Ernest Hébrard, which created the outline of Thessalonica as it is today through a significant reallocation of properties.

Dramatic changes were to occur in the following years, which affected the ethnic composition of the city, namely the arrival of thousands of destitute Christian refugees from Asia Minor in 1922 and 1923 and the fall of Greece to the Nazis in April 1941. In March 1943 the German authorities deported the Jewish population of Thessalonica by train loads to the Nazi extermination camps, from which only a few were to survive. Of the 50,000 Thessalonica Jews 95 per cent perished. The city suffered the disruptive consequences of the Civil War (1946–49) and was able to begin its economic recovery only in the early 1950s.

Summary

Founded by Cassander in 316 BC, Thessalonica was an amalgam of 26 older towns and villages. It was the port of Macedonia and prospered as a centre of commerce and industry. It lay on the Via Egnatia which connected Constantinople with the Adriatic. It had a Jewish community in antiquity and was visited by St Paul. It was raided by Slavs and Avars in the 6th century, sacked by Arabs in the 10th, and taken by Latins in 1204. Finally taken by the Ottomans in 1430, it received an influx of Spanish Jews in 1492. It was liberated by the Greek army in 1912.

Thessaly

Region of central Greece

Thessaly is an easily identifiable area, bounded by the Pindus mountains on the east, Pelion and Ossa to the south, and Mount Olympus to the north. In between there are two large plains, divided by a range of hilly country. These plains, at the centre of which lie Larissa and Trikkala, are much larger than any other comparable area in Classical Greece, and perhaps explain why Thessaly in both ancient and modern times has not followed the pattern of the rest of Greece. The climate is a little harsher. Thessaly never really developed the city state. The territory became Greek in 1881, well before Macedonia and Epirus, but long after the rest of Greece. Though more clearly Greek than either Macedonia or Epirus, it used to contain a large Turkish element in its population and still contains many Vlachs. It has an extensive coastline and a major port in Volos, but is far less bound to the sea than most of Greece. The olive and the vine grow less well, but traditionally Thessaly has been rich in horses, cattle, and grain.

Thessalians figure in the Homeric catalogue, and Achilles came from Pthiotis in the southeastern portion of Thessaly. The Thessalians of the Classical period appear from their dialect to have been a mixture of the original Homeric element and invaders such as the Dorians from the northwest. The latter appear to have ruled as an oligarchy with one of their number elected as *tagos* or leader of the whole of Thessaly. An early family to achieve prominence were the Aleudae, based on Larissa, but they lost favour through supporting the Persians. In the Peloponnesian War the Thessalians were generally on the Athenian side, but not very effectively. Jason of Pherae in the 4th century BC gained considerable power, but his assassination prevented him from anticipating Philip of Macedon, who easily gained control of a divided Thessaly. Thessalian cavalry formed an important part of Alexander's army, and Thessaly generally remained loyal to Macedon until the Roman victory at Pydna in 168 BC.

While the rest of Greece on the whole suffered under Roman rule, there are complimentary references in Latin literature to Thessaly's plains, mountains, and rivers. Lucan, though mainly concerned with mythology, gives a glowing tribute in his *Pharsalia*. A Roman colony at Dium and a good

road from Thessalonica to Athens ensured a plentiful Roman presence, well attested by inscriptions. Larissa and Tricca (Trikkala) were the main towns. Towards the end of the 2nd century AD Apuleius paints a gloomier picture of brigandage and witchcraft. The barbarian invasions in the Roman empire's declining years sometimes reached as far as Thessaly, and when the Danube frontier finally broke in 602, western Thessaly was soon lost to the invaders with Byzantium maintaining a precarious control only over the coastline. As late as the end of the 10th century Larissa was sometimes in the hands of the Bulgarian tsar Samuel. Even after the conquest of the whole of the Balkans by Basil the Bulgar slayer there was always a threat from rebellious Vlachs in the mountains and from western invaders like the Norman Bohemund, who crossed the Pindus mountains and besieged Larissa before being defeated by Alexios Komnenos in 1083.

After the Fourth Crusade of 1204 Thessaly passed under various rulers before the Turks arrived at the end of the 14th century. Originally it was part of the subordinate Latin kingdom of Thessalonica which Boniface of Montferrat had carved out for himself after failing to gain the throne of Constantinople. Then in 1224 it was captured by Theodore Doukas of Epirus and, in spite of Byzantine successes at Pelagonia in 1259 and the reconquest of Constantinople in 1261, it remained under the rule of a member of the Doukas family, being independent of Epirus from 1271. In 1318 the Catalans gained possession of southern Thessaly, while Stephen Gabrieloupolos preserved a precarious independence in the north. The frequent changes of ruler and the presence of so many external threats cannot have made Thessaly a peaceful place, and it was in the 14th century that the extensive monastic foundations of the Meteora were established, no doubt as a place of refuge from the strain of the internal and external strife. In 1335 the Palaiologoi briefly under Andronikos III regained both Thessaly and Epirus, but there was a new danger in the north in the shape of the Serbs. A disastrous civil war (1341–47) between John Kantakouzenos, a great landowner in Thessaly and a benefactor of the Meteora, and John Palaiologos gave the Serbs their opportunity and in 1348 Stephan IV Dushan conquered both Thessaly and Epirus. On his death his half-brother Symeon Uroš ruled for a time; his mother was a Palaiologos and wife a Doukas. But Symeon's son did not rule in his place, retiring instead to the Meteora to end his days as Father Iosaaph. The Turks conquered Thessaly in 1393, although Manuel II Palaiologos (1391–1425) briefly recovered the eastern coastline after the Battle of Ankara.

The Turks were rulers of Thessaly for nearly 500 years. Arriving early in the rich plains with a similar climate to Anatolia, they settled there in considerable numbers, often reducing the original inhabitants to near serfdom, forced to work the land with few rights and heavy taxes. In the mountains the Greeks and Vlachs had more independence, often gaining special privileges in return for nominal duties as guardians of passes. As the central authority became weaker we have evidence from western travellers and from Greek and Vlach folk song of how the independent mountain villagers were able to deceive the Turks by adopting a dual role as *armatoloi*, guardians of law and order, and klephts, disturbers of the peace. No doubt the success of these heroic manoeuvres is exaggerated in our sources, and other Thessalians played a more pacific part. In the 18th century the villages of Pelion with their distinctive houses became an intellectual centre of Hellenism, while the cotton merchants of Ambelakia on the slopes of Mount Ossa established a thriving trade.

Thessaly remained in Ottoman hands after the rest of Classical Greece had been granted independence in 1830. Greece was not formally represented at the Congress of Berlin in 1878, and it needed a general mobilization in 1880 to secure the cession of Thessaly in 1881. In 1897 a disastrous war against Turkey resulted in a major defeat for the Greek forces in Thessaly and there were small frontier rectifications in Turkey's favour. Between 1881 and 1912 Thessaly was a frontier province and a haven for freedom fighters in Macedonia and Epirus.

The Balkan Wars, World War I, and the Greek disaster in Asia Minor of 1922 brought about a major change in Thessaly's position. It was no longer a frontier province. Population exchanges meant that there was no longer a substantial Turkish element in the area. Immigrants from Asia Minor who replaced them were sometimes rich merchants who took over the privileged position of the Turkish landowners, sometimes landless refugees with left-wing sympathies. In World War II and the Civil War that followed it Thessaly played a crucial part since through it lay the life-line from Athens to Thessalonica. Forces of ELAS (*Ellinikos Laikos Apelevtherotikos Stratos*, the Greek Popular Liberation Army) were strong in the area, hindering first the German occupation and then the royalist government. Support for ELAS was strong, as was resentment against it. The head of Ares Velouchiotis was exhibited briefly in Trikkala after his death in 1945.

Such a bloodthristy episode seems at variance with the position of modern Thessaly, peaceful if unexciting. With little in the way of Classical sites and few beaches except in more remote Pelion, Thessaly has escaped the perils of modern tourism, but has prospered from European Union support for agriculture. Volos and Larissa are among Greece's six largest towns, but well below Athens and Thessalonica in population. The slightly provincial note about Thessalian society is perhaps best shown by the fact that it features in modern Greek literature very infrequently, although there is a novel, *The Beggar* by Andros Karkavitsas, written in 1896 and set at the foot of Mount Olympus.

T.J. WINNIFRITH

Summary

A region of central Greece, Thessaly did not develop into city states but was ruled by an oligarchy in the Classical period. Its plains were famous for horses. Invaded by Slavs in the 7th century and Bulgars in the 10th, Thessaly changed hands many times between 1204 and the Ottoman conquest in 1393. It was united with Greece in 1881.

Thrace

Region bordering the north Aegean

Thrace and Thracians are the names given by the ancient Greeks to the territory and the people living in the region bordering the north Aegean. Neither the origin of the name nor the local name for this large territory is known. Over time the boundaries of Thrace changed. It was at its greatest extent in the 5th century BC when the Odrysian kingdom was established, stretching over present-day Bulgaria, east of the Hebrus (Turkish Thrace), and Greece between the Hebrus and Strymon, except for the coastal areas from the Danube to north of the Hellespont, and from Constantinople to Strymon in southwest Bulgaria. The territory was rich in fertile plains, forests, fish, precious metals, and iron and copper ores. The Thracians who are mentioned by Homer (*Iliad*, 6. 130, 9. 5, 14. 227, etc.; *Odyssey*, 8. 361) were agricultural tribes. Ancient writers give the names of many Thracian tribes: Tribali, Odrysae, Dardani, etc. They were a warlike, rural people, ruled over by various dynasties. The king of Odrysae was the dominant figure in the Classical period, until Philip II of Macedon invaded Thrace in the 4th century BC and established various cities including Philippopolis (Plovdiv). After the death of Alexander the Great in 323 BC Thrace fell to Lysimachus.

Greek colonies were established on the shores of Pontic Thrace from the end of the 7th century BC (Apollonia Pontica, Mesembria, Odessus) and from the middle of the 7th century BC in Aegean Thrace (Abdera, Maroneia, Aenus, Perinthus). Orpheus, the mythical singer, son of Apollo and a Muse, is generally called a Thracian and Thrace was considered to be his home. His grave and cult belong not to Thrace but to Pierian Macedonia, northeast of Mount Olympus, a region that the Thracians had once inhabited. Orpheus' song had superhuman powers and an important consequence of his miraculous song was his creation of Orphic poetry. The image of Orpheus was very popular in Greek and Roman art. In Attic vase painting he was represented in oriental as well as Greek costume. Several vases show him being killed by Thracian women.

The close links between Greece and Thrace are demonstrated not only by the depiction of Thracians in Attic vase painting but also by the introduction of the cult of the Thracian goddess Bendis to Athens in the 5th century BC. Greek artists represented her as a booted huntress, like Artemis. A priestess was assigned to her by one of the decrees of 413/12 BC and a great festival was established in Piraeus, at which twin processions of native Thracians and Athenians were followed by a torch race on horseback, and celebrations continued all through the night.

Thracian religion is a much-debated subject. The information given by ancient writers, especially Greeks, presents the Greek interpretation of local religious beliefs. Herodotus (5. 7) states that the Thracians worshipped Ares, Dionysus, Artemis, and Hermes. The similarities between the worship of a Great Goddess and the cult of Artemis in Asia Minor or of Cybele are obvious. The idea of heroization was restricted to members of the nobility and royal family. The existence of a cult of Helios is attested not only in Greek literature (Sophocles, *Tereus*, fr. 582) but by archaeological and numismatic data. The most popular cult was that of the so-called Thracian Rider, represented by about 2500 votive stone monuments, often of the rider hunting.

Little is known about Thracian culture of the Archaic period. We have much more evidence from the period of the establishment of the Odrysian kingdom in the 5th century BC, although our knowledge of Thracian culture is confined to that of the ruling elite. The Thracians were very advanced metalworkers, and many metal objects made of gold or silver, especially drinking vessels, are known from the tombs of local rulers and nobles; Greek and Achaemenid or Achaemenid-type vessels are also known. Stylistically, there is a mixture of Greek, Achaemenid, and local elements. The quantity of vessels and pieces of jewellery found in tombs is quite impressive. The information provided by Thucydides (2. 37) concerning gift giving and tribute collected from Greek cities and from "all the barbarous nations" in the reign of Seuthes (424–*c*.408 BC), the king of the Odrysae, makes it clear that the Odrysian kingdom was similar to the Achaemenid empire in that the king exploited Greek craftsmen to create his culture. Excavation of the settlement at Vetren, in the Thracian hinterland not far from Plovdiv, shows that this practice began in Thrace in the mid-5th century BC. This settlement, the residence of the local ruler, was built entirely by Greek architects and masons, as the planning and layout, paved streets, and, most importantly, city-gate and fortification system demonstrate.

Greek influence on local elite culture was strong. The nobility used the Greek alphabet, as seen on a ring and vessels from the Rogozen Treasure (now in the National History Museum, Sofia). In the Hellenistic period the Greeks became even more heavily involved; for example, the town planning and architecture of Seuthopolis (which had an agora), as well as its fortifications, are examples of Greek craftsmanship and masonry, as in Vetren. Inscriptions, legends on coins, and stamps and graffiti on Thracian pottery all indicate that the Greek language was very much used in Seuthopolis. In this royal city, built and decorated entirely by Greeks, temples as well as Thracian clay altars were found. The religion shows very strong Greek influence. Another royal city, Cabyle, archaeologically less well known, has an inscription in ancient Greek which is identical to that found in Seuthopolis. The Getic capital at Sboryanovo, which has been studied since the late 1980s, has also revealed a stone fortification system, stone architecture, and inscriptions in Greek.

Greek masons were further employed to build and decorate tombs. In the chamber of the barrel-vaulted tomb at Sveshtari a Doric entablature is supported on the raised hands of women, with the help of five Corinthian half-columns: this is redolent of Greek caryatids. There are impressive murals in a tomb at Kazanluk: chariot races, a Greek decorative frieze of bowls and bucrania, and figures approaching the dead prince and his consort seated at a table. All the trappings and furniture are Greek. Since the 1980s excavations in the Shipka area have brought to light several dozen rich tombs, some decorated with very impressive murals.

Roman involvement arose from Thrace's links with Macedonia. After the Macedonian revolt of 149 BC (in which Thrace was heavily involved) was put down, Rome aimed to stabilize the area by establishing client kings in Thrace. These continued until AD 46 when the country was annexed and made into a province. It became one of the most important Danubian provinces of the Roman empire, and protected the lines of communication from Macedonia to Bithynia and Asia Minor via Byzantium. Barbarian ravaging of Thrace, which began with the Goths passing through in a swathe of destruction, continued in the 4th and 5th centuries AD.

Under Byzantium, Thrace, especially along the Black Sea littoral, continued to be an area of Hellenic culture, as it had been in the Graeco-Roman period. Bulgarian churches show strong Byzantine influence. The earliest surviving example, dating from the 5th century AD at Nessebur (Greek Mesembria), was constructed as a conventional basilica, with aisles added in the 8th century when the main arcade columns were changed to square piers. Medieval churches exist throughout Bulgaria, many dating from the second Bulgarian empire (late 12th–13th centuries), and most have the typical Greek cruciform plan. Many contain frescos demonstrating very strong Byzantine influence, particularly the Ivanovo rock churches. Monasteries, 150 at the peak, flourished as centres of Christian culture and literacy, Rila and Bachkovo among the most prominent. They house very fine collections of illuminated manuscripts and icons, which, once again, betray the closeness of links with Byzantium. Many Bulgarian monks lived and worked on Mount Athos.

The Bulgars, a non-Indo-European people, had a long migrant history before entering Europe in the wake of the Huns. They crossed the Danube in the second half of the 7th century AD and settled in Moesia (modern Bulgaria), gradually fusing with the resident Slavs and spreading further to the south and west. From khan Krum's defeat of the Byzantine emperor Nikephoros I in 811, Byzantium's most disastrous defeat for a considerable time, until the overwhelming victory of Byzantium at Kleidion in 1014, the first Bulgarian empire was a power with wide dominion over the mid-Balkans. Christianity was accepted in 865 at the hands of Sts Cyril and Methodios, the former devising the Glagolitic alphabet, based on Greek characters, which is the ancestor of most modern Slav scripts. Although all of Bulgaria passed back to Byzantine control, the Church remained autonomous. The second Bulgarian empire lasted from the late 12th century for less than a hundred years. The centre of Balkan power moved into Serbia and the whole of Bulgaria passed under Turkish control in the 14th century.

In the first half of the 19th century many monasteries were restored: Rila, Troyan, Bachkovo, and Preobrazhenski were repainted by Zakhari Zograph from Samokov, who also worked on Mount Athos. This reflects the importance of the Church in stimulating a "national revival". Modern Bulgaria arose from a nationalist revolt in the 1870s, combined with the Ottoman decline and strong pan-Slavist Russian support. The other Great Powers intervened to prevent the Bulgaria (including most of Macedonia and part of the Thracian seaboard) envisaged in the San Stefano treaty of 1878 disappearing. Northern Bulgaria achieved de facto independence under nominal Turkish suzerainty; Eastern Roumelia, newly autonomous within the Ottoman empire, joined it in 1885 (a position not regularized until formal Bulgarian independence in 1908); and other territories were added from Turkey (including western Thrace) and lost (to Greece – western Thrace; Romania and Serbia) as a result of the two Balkan Wars of 1912–13 and World War I. Between the wars a limited population exchange of Greeks and Bulgarians took place. Until 1944 Bulgaria skilfully avoided participation in World War II but used its German alliance to reoccupy many lost territories and much of its San Stefano inheritance. Disaster struck in September 1944: the country found itself simultaneously at war with Germany and Russia and undergoing a communist-backed putsch. Territory was lost again and the Bulgarian elite cut down on a scale not seen since Kleidion.

Summary

The boundaries of Thrace, a region bordering the north Aegean, have changed much over the centuries. Greek colonies were established on the Black Sea coast from the 7th century BC. From the Classical (Odrysian) period much metalwork and jewellery of Greek craftsmanship survives. Thrace was even more Hellenized in the Hellenistic period. It became a Roman province in AD 46. Under Byzantium it remained an area of Greek culture. Its borders have changed frequently since the creation of modern Bulgaria in the 1870s.

Thucydides

Athenian historian of the 5th century BC

Thucydides was a member of an Athenian aristocratic family which owned gold mines in Thrace and was connected at least by friendship, possibly also by marriage, with the local Thracian aristocracy. In 424 BC, during the Peloponnesian War between the Athenian empire and the alliance headed by Sparta, he held an amphibious command on the Thracian coast, but went into exile in consequence of his failure to prevent the Spartan capture of a strategically valuable city. He returned to Athens in 404 BC, when all the exiles were recalled, and died probably about 395 BC.

According to his own account, when the Peloponnesian War began in 431 BC he decided to write its history. This ambition was not completely realized, because his work, which survives, ends abruptly in the winter of 411 BC, though passages elsewhere refer clearly to the end of the war in its 27th year. His account (book 8) of the 20th and 21st years differs in character from books 1–7, and may represent a stage intermediate between a first draft and a final version. Histories of the last six years of the war were written by others in the 4th century BC.

Thucydides was not the first major Greek historian, for Herodotus' history of the Persian invasion of Greece appeared a generation earlier, but he was nevertheless a pioneer who did much to shape the form and nature of subsequent historiography. In particular, he put speeches, condensed in language and thought, into the mouths of his personages on critical or otherwise memorable occasions. The most famous has long been the funeral speech of his Pericles in book 2, at the burial of the war dead of 431 BC. The speeches are sophisticated in language and replete with moral, political, and psychological generalizations. There are, of course, abundant speeches in Homeric epic, and quite a number in Herodotus, but Thucydides is peculiar in that he had been present on some of the occasions which he adorns with speeches, and could have learned much about the rest from contemporaries. Aware of the role of the spoken word in determining the decisions of the Greek city states, in his preface he divides the content of his work into "what was said" and "what was done", and claims that he had recourse to inventing what speakers "needed" to say only when he could not recall or discover what they actually said. The extent to which this claim is compatible with what we read in his text (in books 1–3 speeches amount to nearly a third of the whole) is a focus of controversy which is likely to continue. Whatever his own intention, he unwittingly set a bad example to later historians, Greek and Roman alike, who, writing for a culture devoted to the art of oratory, assumed the right to invent speeches.

In narrative his style is usually simpler than in speeches, and sometimes vivid and dramatic, but his generalized descriptions of situations (for example, the moral effects of the plague in book 2 and the disastrous spread of civil strife in book 3) are hard going. He experiments with syntax, deploys a stock of unusual abstract nouns (some probably coined by him), and often seems to be trying to convey too much in too few words. Our problems as readers might well be solved if we could hear him reading his own text aloud and could note his placing of stress and pause. Since ancient literary critics could no more do that than we can, they found him a difficult author and often disagreed over his meaning.

Such experimental language is one aspect of the tendency among intellectuals in his time to innovation and rejection of tradition. Save in one doubtful instance, he is sceptical about oracles, never attributes historical events to divine intervention, and gropes after scientific explanations of natural phenomena. In these respects he is much nearer to early medical writers than to Herodotus; indeed, he seems to have modelled his description of the plague on them, though differing from them in terminology. In a few articulate intellectuals the shift from a religious to a scientific world view generated the idea that the good and admirable person is the one who (following the law of nature) imposes his will on others for his own self-aggrandizement. Thucydides certainly does not think that. The belief that he does, still widespread, is generated by the error of treating arguments put forward in this or that speech as if they were his own.

He is undeniably an impressive, magisterial writer, professing strong attachment to accuracy and adopting a detached view which only rarely wavers under pressure from his emotional reactions and predilections. A sombre tone manifest in some of his observations on human behaviour may also be inferred from some of his apparently "deadpan" statements, and this has given him, over the centuries, a reputation for integrity, profundity, and wisdom. He was extensively read and studied in Byzantium; Procopius in the 6th century AD borrowed whole passages, and in the 12th century, while the scholar Tzetzes was exasperated by Thucydides' obscurity, Anna Komnene strewed her history with unusual Thucydidean expressions, thereby enlarging the gulf between classicizing language and the vernacular of her time. Thucydidean language and style (with some injections from Herodotus and Polybius) continued to serve as a model for Byzantine historiography; a notable example is the work of the emperor John VI Kantakouzenos in the 14th century. He was translated into Latin by Lorenzo Valla in 1452, and into English in 1628 by Thomas Hobbes, who idolized him, not least for his exposure of what Hobbes regarded as the follies of democracy.

In Greece, Neophytos Doukas prepared an edition of Thucydides with Latin translation, published in Vienna in 1805. Korais in his *Hellenic Library* ignored Thucydides, either because Doukas had got in first or because Thucydides was unedifying and insufficiently philosophical. The difficulty of the language came to be recognized as a serious obstacle to Thucydides' attainment of the central place in educational curricula that his fame might seem to justify, and in 1920 the statesman Eleftherios Venizelos embarked on a translation into a somewhat literary demotic Greek, published posthumously in 1937. Venizelos believed (as Thucydides himself did, to judge from what he says in his preface) that constants in human behaviour are such that a careful and wise account of an ancient war abounds in political lessons which are still valid.

But *is* Thucydides "careful and wise"? Is he even a reliable authority on the details of his narrative? In the 20th century no other Greek author has been subject to so heavy a revisionist onslaught. A general decline in reverence reminds us that a gifted writer can profess devotion to truth and then compose a

narrative that is largely fiction. Modern standards of historiography make us aware that a narrative such as Thucydides' comprises many thousands of data, of which only a very small fraction can be checked against other relevant evidence. On topographical matters he is sometimes wrong; and when what he says is irreconcilable with what is said by later historians patently drawing on independent sources, we cannot simply assume that he, the master, must be right. No later historians, of course, can be treated as "confirming" him, because they may be drawing on him. He virtually never reveals, let alone discusses, his sources, but expects us to trust him to have put the right questions to his informants and to have pursued them until he got what we would regard as adequate answers. He very often makes firm statements about the hopes, fears, plans, and ambitions of individuals, and it is a failure of historical curiosity on our part if we do not ask, "How did he know?" There is a certain arrogance in his declaration that he begins his history with an account of the causes of the war "so that no one need ever seek to discover how so great a war arose"; little did he know how much would be written in our time on precisely that question.

Historians are necessarily selective, for otherwise their task would never be done, but selection presupposes at least a tentative interpretation, no matter what may be added or subtracted in the definitive interpretation. Given massive evidence, it is easy to discern what underlies a particular historian's selectivity, but our evidence for the Peloponnesian War is far from massive. The most interesting aspect of Thucydides' selectivity is his allocation of space: four lines on the massacre at Scione, six pages for the dialogue between Athenian and Melian negotiators preceding the siege and eventual massacre at Melos. Selection apart, it is suspected that Thucydides on occasion went beyond mere exaggeration, beyond an illegitimate slide from "must have been" to "was", and had recourse to fiction in order to assimilate his narrative to the theatrical unfolding of a Greek tragedy. The implausible role which he consistently assigns to pure chance in the account of the fighting at Pylos (in book 4) is notably vulnerable to this suspicion. However, the evidence that he embraced fiction on that occasion and may possibly have done so on others falls far short of proving that he had any intention of turning historical exposition systematically into myth. A chain of tragic events must necessarily resemble tragedy, and before denying Thucydides the status of historian we would need to discount the immense quantity of down-to-earth details which constitute by far the largest ingredient of his work.

Timaeus

Historian of the 4th–3rd centuries BC

Timaeus of Tauromenium in Sicily, a Greek historian of the front rank, was born in the middle years of the 4th century BC and died in the late 260s BC in advanced old age. Naxos, the original home city of his family, was destroyed by Dionysius I of Syracuse in 403 BC. In 358 BC Timaeus' father Andromachus gathered together all the surviving Naxians and settled them at Tauromenium. There Timaeus was born and there he lived until the mid-310s BC when he was exiled by the tyrant Agathocles of Syracuse. He took refuge in Athens where he spent the next 50 years, first studying under a former pupil of Isocrates, and subsequently researching and writing in that city's libraries, for which he was derided by Polybius as a pedant and an armchair historian par excellence. Possibly he died at Athens.

As a preliminary to his historical work he researched (at Olympia) and published a study of Olympic victors to which he appended, apparently in the form of tables, the correspond-

ing sequences of Spartan kings and ephors, Athenian archons, and priestesses of Hera at Argos. Greek chronology at the time was a highly complex and bewildering affair that hampered the task of serious historians. Timaeus' system of reckoning by Olympiads, though by no means perfect, marked a definite advance and was a commendable effort to impose order on chaos. It was adopted by Polybius, who otherwise had no kind words for Timaeus. Though he lived and worked at Athens, like many another émigré, Timaeus' attention was constantly turned towards the country of his origins, his concern as a historian being the history and achievements of western Hellenism. His *Histories*, in 38 books, were a detailed study of the Greeks of the west, of Sicily in particular, from earliest times until the death of Agathocles in 289/88 BC. To this magnum opus he added a further composition that dealt with the wars in Italy against Rome of king Pyrrhus of Epirus, and which brought events in the west in general down to 264 BC. And this therefore became Polybius' starting point.

As one of the earliest and best of Hellenistic historians, Timaeus' work seems to have combined with some success the various strands and tendencies of Greek historical writing that had been developing since the late 6th century BC. Into a framework of straightforward political and military history (what Polybius called a "pragmatic" history) he incorporated much else of diverse nature, very much in the mould of Herodotus and Ephorus. On the other hand, the unwelcome tendency to dramatize, and indeed sensationalize, historical narratives by, for instance, emphasizing and developing further appropriately pathetic elements in a story, a characteristic of much of Hellenistic historiography, appears to have been a feature of Timaeus too. Furthermore, his Sicilian background and experiences clearly conditioned his work and help to explain certain aspects of it that gained its author notoriety. One such aspect was the extreme hostility with which he dealt with the tyrannies of Dionysius I, Dionysius II, and Agathocles at Syracuse, which took up most of the 4th century BC, a most important period for western Hellenism. As Polybius and Diodorus Siculus pointed out, blinded by personal hatred Timaeus seriously distorted the record of history. The other side of the same coin, which Polybius likewise criticized as a falsification of history, was Timaeus' propensity, when the above tyrants and their associates were not involved, to idealize Siceliots and their achievements.

Yet even when his personal feelings were not involved, Timaeus, it would seem, was far readier to censure than to praise, a trait that earned him the epithet (a play on his name) of "Epitimaeus", meaning the "fault-finder". He was not a respecter of persons, the greatest writers and thinkers being criticized alongside persons of humbler accomplishments. The surviving fragments do not enable us to draw any firm conclusions as to his motives, but in some instances certainly a passion for accuracy appears responsible, as when he criticized Ephorus' arithmetic. Diodorus has preserved for us the respective figures for Carthaginian armaments given by Ephorus and Timaeus and we see that in every instance Timaeus' numbers are far more moderate and realistic. The merits of the *Histories*, therefore, outweighed the flaws and it is not surprising that such a detailed and readable account, one moreover set against a firm and lucid chronological framework of Olympiads, quickly established itself as the standard account of western Hellenism and the western Mediterranean in general, and so it remained for centuries. Undoubtedly a contributory factor here was what Timaeus said about Rome. He was not the first Greek historian to refer to Rome, but he was one of the first to appreciate the city's significance and certainly the first to present a fairly detailed and connected account of Rome's early steps on the international scene. As such he exerted considerable influence on Roman historiography.

Biography

Born in the mid-4th century BC at Tauromenium in Sicily, Timaeus was the son of Andromachus of Naxos who refounded Tauromenium in 358 BC. Timaeus was exiled by Agathocles of Syracuse in the mid-310s and moved to Athens where he studied and wrote his *Histories*, a study of the Greeks of the west in 38 books. He died *c.*260 BC.

Tinos

Island in the Aegean

The small island of Tinos lies to the northwest of the main group of the Cyclades, with an almost equal distance separating it from Andros to the northwest and Mykonos to the southeast; it has an area of 60 sq km. The interior is hilly, with a major mountain formation, called Mount Tsiknia, rising to 713 m in the east of the island; where crops can be grown, often by means of terracing, it is mainly fertile. The silk grown here was the most prized throughout the Cyclades, and for several centuries in the post-Byzantine period it was exported to Italy and France where it was widely bought as a Tiniot speciality.

According to an early tradition, the island abounded with snakes, and due to this it was known as Ophiousa; by tradition, Poseidon sent storks to eliminate the snakes, and the grateful Tinians built a famous temple dedicated to him. In 480 BC Xerxes forced the islanders to serve in his navy in the war with Greece, but before the battle of Salamis one of their ships was able to desert and tell the Greeks of the Persian plans. "For this reason the Tinians were inscribed upon the tripod at Delphi among those who overthrew the barbarians" (Herodotus, 8. 82). In 378 BC the islanders joined the Athenian

confederation and fell under Macedonian control in 338 BC after the Battle of Chaeronea.

Like most of the Aegean islands Tinos suffered from Arab raids in the 9th and 10th centuries, but medieval sources do not mention the island until 1204, when it appears in the Deed of Partition as being one of the eight islands awarded to the Latin emperor; but Venetians, in the persons of Andrea and Geremia Ghisi, were already in occupational control by 1207 as vassals of the emperor. This association with Venetians was to last longer in the case of Tinos than with any of the other Aegean islands, and it was to be more than 500 years before they finally left, being forced by the Turks to evacuate their castle of Exobourgo only in 1715. The Venetian attitude to their last Aegean colony seems to have been equivocal, because an 18th-century engraving of the castle indicates that its fortifications could not have been extensively modernized, and that their commander could never have been expected to hold it against the overwhelming might of the Turkish forces; yet on his return to Venice he was tried and imprisoned for his act of supposed cowardice. In the peace agreed with the Turks in 1540 Tinos, with Crete, Cyprus, and some of the Ionian islands, had been even then the only Aegean island still to remain in Western hands.

Due to this long Western presence Tinos always had (and continues to have) the largest Roman Catholic population of any of the Aegean islands; in the 17th century their number was greater than all the rest of the Cyclades together. Tinos also came to be linked closely with Mykonos, and for centuries the two islands shared a Latin bishop. Today a large Roman Catholic Neoclassical church (renamed in 1895 as the church of the Sacred Heart), and an Ursuline school for girls at Loutra, remain as evidence of the continued Western involvement here.

Tiniots, both Orthodox and Catholic, became known in the 17th and 18th centuries for their industry and honesty, in contrast to the Naxiots. The islanders took part in the War of Independence with other islands of the Cyclades, but in 1833 their individualism took the form of a minor insurrection against the regency, which resulted in the imposition of martial law. The event that may have ultimately contributed more to the modern fame of Tinos, both within the Hellenic sphere and in the world outside, and has certainly brought substantial wealth to the island, was the "discovery" in 1822 of an icon of the Virgin which is believed to have miraculous powers. It was made by a nun, Pelagia, and every year on 25 March and 15 August the island is visited by thousands of pilgrims coming to honour it, many climbing the street from the harbour to the large church of the Panagia Evangelistria on their knees.

Summary

One of the Cyclades, Tinos was occupied by the Mycenaeans. In antiquity it was said to be famous for snakes. In later periods it was famous for its silk. It was in Venetian hands from 1207 to 1715, longer than any other Aegean island, which accounts for its large Roman Catholic population. It has been a centre of pilgrimage since the "discovery" in 1822 of an icon to which miracle-working powers have been attributed.

Tiryns

Bronze Age city in the Argolid

Tiryns is described by Homer as "wall-girt" and, in the catalogue of ships, it formed part of the realm of Diomedes, ruler of Argos. The north/south division of the Argive plain that this implies may now be justified on recently expanded evidence of the Bronze Age road system. In myth Tiryns was the seat of Eurystheus who inflicted the 12 labours on Heracles, and thus features in several of Pindar's odes.

The site lies in the southeast of the Argive plain on an isolated limestone knoll rising some 20 m above the surrounding area; it divides naturally into three sections known as the Oberburg, Mittelburg, and Unterburg. Geomorphological work indicates that in the Late Bronze Age the sea lay only 1 km from the foot of the knoll. Tiryns may thus have been the main port for the Argolid at a period when boats were beached rather than moored or anchored. In the 12th century BC the settlement extended widely around the site. Lack of evidence for this feature from earlier periods is thought to be the result of deep deposition from a flash flood that buried the settlement under alluvium. To prevent further inundation an extensive barrage was built higher up the valley to divert the torrent into another streambed. A hill to the southeast has two tholos tombs built into the west face and a series of chamber tombs (15 fully excavated) on the east. Further cemeteries for the 15th to 12th centuries BC remain to be found.

Excavation was begun in 1831 by Friedrich Thiersch and Alexander Rizos Rangabé and continued by Heinrich Schliemann in 1876. From 1884 Schliemann with Wilhelm Dörpfeld carried out a systematic exploration for the Deutsches Archäologisches Institut, which continued at intervals until 1929. Restoration of the walls was initiated by the Greek Archaeological Service in the late 1950s and led to discoveries requiring further excavation. In 1965 the DAI resumed its work under the direction of Klaus Kilian; the work of publication and clarification continues despite his early death.

Settlement on the site dates back to the Neolithic period (5th millennium BC) but the earliest architectural remains of importance belong to the Early Helladic period. A round building was built on the top of the citadel; it is considered to be one

of the series of large monumental buildings built for public or elite use in the EH II period (early 3rd millennium BC) but is the only one of this particular type known to date.

The site was continuously occupied but there are only scattered remains of structures before the Mycenaean period. Then a series of major buildings, usually known as palaces, were constructed on the Oberburg and fortifications of Cyclopean type built around each of the three sections of the site. Several features are particularly notable. A room floored with a single slab of limestone is identified as a bathroom. The so-called galleries are passages that led to storerooms, all corbel-vaulted and built within the thickness of the fortification walls. A similar passage, this time curving, led through a bastion to a small west gate. On the west side of the Unterburg two similar passages led through the wall and underground at a distance of *c.*30 m to sumps where water collected, thus affording an emergency supply of water approachable only from within the walls.

In post-Mycenaean times, probably in the Geometric period, the central megaron was divided and a small temple created. This was dedicated to Hera. To the same period may be assigned the final square phase of an altar in the inner courtyard. Well-equipped tombs of the Protogeometric and Geometric periods have been excavated from immediately south of the citadel. A notable find has been identified as a helmet of Protogeometric date. To the Archaic period can be assigned a group of unique votive offerings including terracotta shields painted with scenes of warfare and gorgon masks as well as many more usual small terracotta figures of women. Also of the Archaic period are inscriptions carved on the upper outer face of the stones that roofed the passages leading to the underground water supply. These indicate that the partially destroyed wall was used at this point as seating for the population in an assembly. Tiryns joined with Mycenae in sending troops to fight the Persians at Platea in 479 BC, and a decade later suffered a similar destruction at the hands of the Argives. The population is said to have migrated to Haleis (modern Porto Cheli) at the southern end of the Argive peninsula, where numismatic evidence supports the claim.

Strabo describes Tiryns in terms similar to those he uses for Mycenae, as a site once famous and now without significant habitation. Pausanias mentions only the walls. In Roman times an olive press was constructed inside Tholos I. A small Middle Byzantine church was built over the inner side of the outer wall at the south of the Oberburg. Around it were several graves. Both church and graves as well as a threshing floor that had been built above them were removed in excavation to reveal the Mycenaean site.

The first description of the site by European travellers is by the French envoy de Monceaux in 1668. Around the start of the second Venetian occupation of the Morea (1686), Piero Antonio Pacifico states that the site was barely inhabited; unfortunately he does not give a description. It appears correctly placed on the maps of Barbié de Bocage (late 18th century) and is mentioned by many 19th-century travellers. Among the illustrations that they made, a watercolour by Rottmann (now in the Graphische Sammlung, Munich) and a sketch by Edward Lear (J. Fitton collection) are particularly attractive. Others indulge in a rather Gothic interpretation of the massive masonry.

Finds from all periods, though mainly pottery, are exhibited in Nauplia while the outstanding finds of the Mycenaean period, including frescos, the carved stone base of a throne, and a group of small objects of various dates known as the Tiryns Treasure are on display in the National Museum in Athens. Following structural damage there is only restricted access to the site for visitors.

Summary

Located in the southeast of the plain of Argos, Tiryns was inhabited from the Neolithic period. A series of major buildings (palaces) dates from the Mycenaean period when it was (in myth) the seat of Eurystheus. It may have been the port for the Argolid. There are some remains from the Archaic period but Tiryns was destroyed by Argos in the 5th century BC.

Tobacco

Tobacco was first cultivated in Greece during the early years of 17th century. Because Greece is a mountainous country with a climate marked by long dry periods in summer, the cultivation of tobacco was a natural choice. The regions that are major tobacco producers are Macedonia, Thrace, to a lesser extent Thessaly, and some parts of western Greece where the weather and soil conditions are ideal for the cultivation of the product.

Before the First Balkan War (1912–13), the districts that accounted for much of the production of tobacco were under Turkish occupation and most tobacco farms were in the hands of few Turkish landlords. Many of the landlords were nobles with limited agricultural education. They usually resided in Constantinople or Thessalonica, and had very little knowledge of or interest in the technological developments that might have enabled them to intensify and modernize the cultivation of the product. Absent from their lands, they relied entirely on the uncertain productive capacity of their tenants. These tobacco growers, working under various restrictive practices, inadequately equipped, using traditional methods of cultivation, having to bear various tax abuses and extortionate credit terms, were heavily dependent on weather conditions. There was little incentive to increase tobacco output since any additional profits were unlikely to end up in their pockets. Small

independent tobacco growers, on the other hand, although more efficient as producers, suffered from similar disadvantages and were probably more vulnerable to bad crops than tenants since they were not always self-sufficient in labour, given the manpower that tobacco production requires. The harvest was sold mainly to Greek and foreign merchants, at prices dictated by them, to be exported.

With the annexation of Macedonia to Greece and after the Asia Minor disaster of 1922, a number of laws were passed redistributing most of the fertile land to the impoverished tenants and refugees. The arrival of refugees, many of whom were tobacco growers, resulted in an increase of the skilled labour force and the introduction of modern cultivation methods. The cultivation of tobacco was one of the main activities of the refugees, especially in Macedonia and Thrace. The revenue gained from selling the crop greatly mitigated their hardships in those difficult times and accelerated the restoration of their livelihood in their new home.

The tobacco industry greatly benefited in the early 1930s from an increasing demand for the oriental type of tobacco that Greece produced in large quantities. Prices doubled and tripled in a few years, a development that significantly improved the living conditions for both cultivators and retailers. According to some estimates, 10 per cent of an area cultivated with wheat, if planted with tobacco, could give an export value 10 times greater than the whole of the area under wheat cultivation. Greek firms were gaining ground in the international markets not only with the trading of tobacco but also with the production of cigarettes, at home and abroad.

The presence of Greek cigarette manufacturers in Egypt is particularly notable. The majority of them settled in the country after a monopoly granted by the Porte in 1897 to a firm in Constantinople for the production and sale of tobacco. Egypt had the advantages of a very cheap labour force, easy access to a great variety of Greek and Turkish leaf tobacco needed for the production of superior-quality cigarettes, and a dry climate which, although unsuitable for growing anything but low-quality tobacco, was ideal for processing the imported leaf into cigarettes. Despite their dynamism, the Greek cigarette manufacturers in Greece and abroad before the start of World War II faced a number of internal and external problems such as lack of modernization and fierce competition from foreign capital. Most Greek manufacturers in Egypt in the late 1930s were unable to compete efficiently with the foreign firms and sold their factories. The same to a lesser extent was true of manufacturers in Greece.

Until the early 1930s, state policy with regard to the tobacco industry and the agricultural sector in general suffered from a lack of coordination of means and ends. This reflected in part the emphasis of the national economic policy towards the development of a sufficient industrial base. The tobacco industry was seen only as a source of income, as is evident from a series of laws relating to control of production and tax evasion. Gradually the importance of the tobacco industry, which employed more than a sixth of the working population, was recognized, and the state took measures to support it. One of the plagues from which producers suffered greatly, given the unavailability of credit, was usury. Banks were reluctant to take over the extremely risky business of financing the small farmers, since commerce was a far more remunerative occupation. For this reason, in 1929, the state established the Agricultural Bank of Greece which set favourable credit conditions for farmers in general and tobacco producers in particular.

After World War II the Greek tobacco industry, with its structural inefficiencies (such as the small size of farms for historical reasons and the low level of modernization), suffered a great setback from the changing tastes of the world market. Oriental tobacco went out of fashion and the American blend was preferred, so Greek tobacco farmers lost their competitive advantage as they had specialized in the former. The foundation of cooperatives was promoted in order to resolve the problems of the size of farm holdings and the low bargaining power that individual producers had in the market. In 1957 the National Board for Tobacco was founded in order to implement and coordinate the state policies with respect to the tobacco industry.

The state increasingly supported the tobacco industry and the agricultural sector in general which was important for social as well as economic reasons. The principal objectives with respect to the tobacco industry included the raising and stabilizing of income and living standards of the farming population, the increase of productivity, and the cultivation of new varieties in accordance with international demand. Because of the political influence of the rural population, subsidies and price supports had been used as income aids. Gradually the policy concentrated increasingly upon support for the tobacco producers through intervention in the market rather than through direct income aids. The National Board for Tobacco became the means of supporting tobacco growers by its marketing and trading operations.

The admission of Greece to the EEC (now the European Union) gave tobacco cultivators, through the Common Agricultural Policy (CAP), great benefits and opportunities to modernize their business in order to compete more efficiently in the marketplace. But the CAP failed to achieve its targets not only because of the farmers' complacency but also because of an escalating antismoking campaign and changing consumer tastes. Nowadays, the Greek tobacco industry is gradually losing the subsidies provided by the state and the CAP as the result of World Trade Organization treaties, and it faces its greatest challenge. If radical measures are not taken soon, the economic survival of tobacco cultivators in Greece without any state support is questionable.

Tourism

Tourism, in the sense of travel undertaken for pleasure, was probably not a common feature of ancient Greece, or in fact of the ancient world as a whole, where the conditions of travel must generally have been far from pleasant. Poor and dangerous roads, uncomfortable inns, expensive and inconvenient transport, and rampant piracy must all have contributed to discourage travel as a pastime.

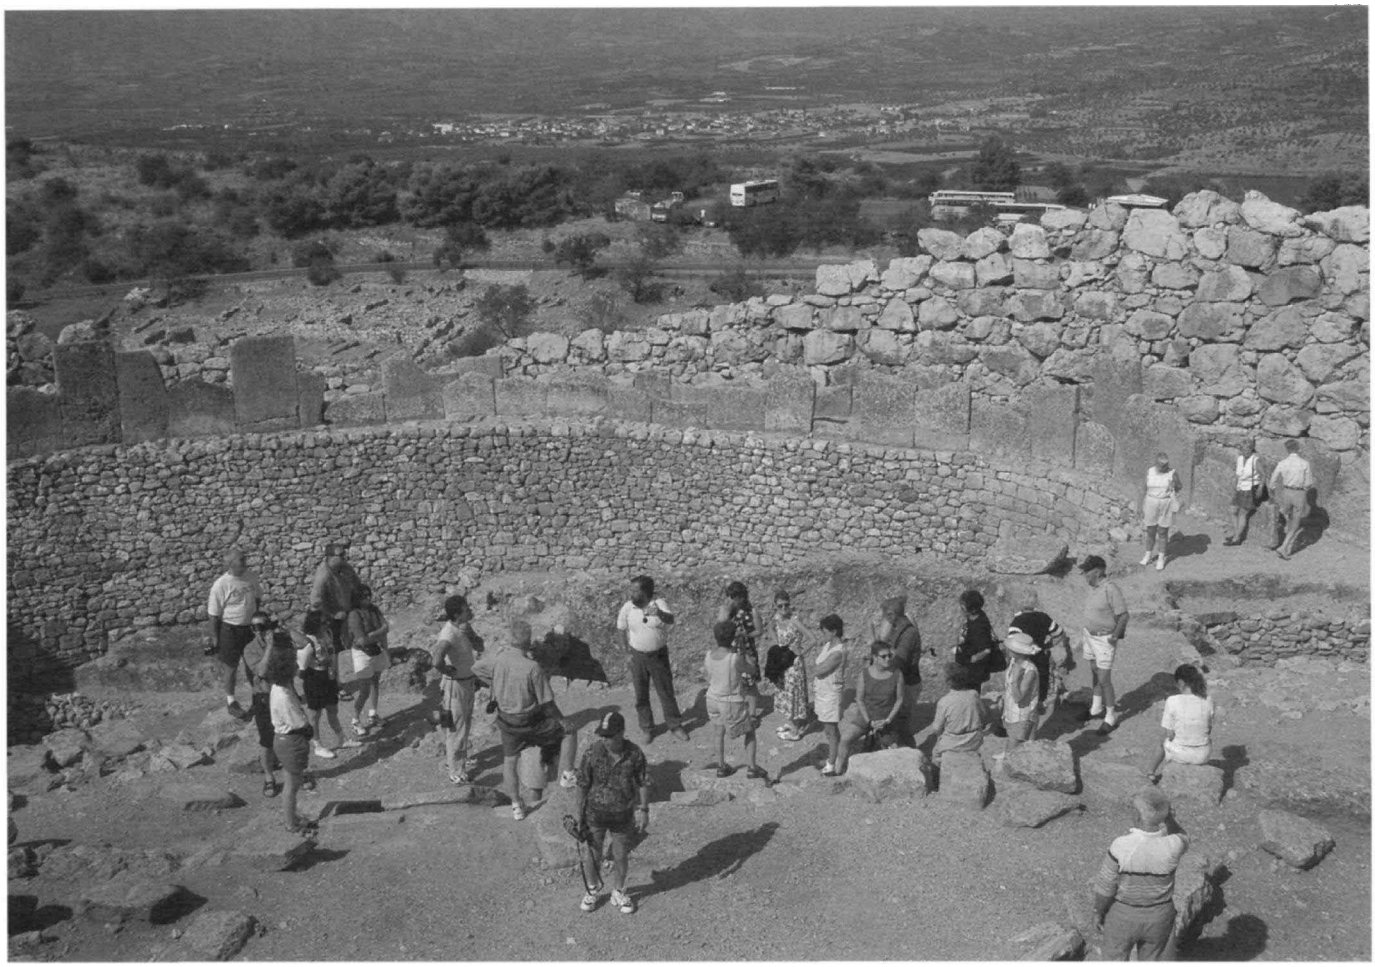
Ancient travellers, however, the wealthy ones in particular, shared many of the objectives of tourism as we know it today: rest, recreation and relaxation, education, religious, cultural, and aesthetic experience, sports, food, shopping, and social contact. They may have retreated to the mountains or the seaside in summer to get away from the congestion or the boredom of the city, as suggested, for instance, by Lucretius (*De Rerum Natura*, 3. 1301–1318). Others probably visited curative thermal spas in search of relief from ill health. In the absence of diplomatic establishments, they relied on guest-friendships between families of different regions.

Although mass tourism is a relatively modern phenomenon, travellers throughout the ages have reacted as tourists, whatever the original purpose of their journeys may have been. From early times seaborne trade, in particular, was closely associated with sightseeing, even though the Greeks, at least those of the Homeric epics, did not show much enthusiasm for seagoing. Yet Odysseus, the ancient traveller par excellence, was admired as one who had seen many cities and visited many nations. Roman country estates and watering places and medieval centres of religious pilgrimage no doubt represent the small beginnings of a tourist industry. Some of the spas frequented by the Romans attracted pleasure seekers as centres of luxury, gambling, and high living. Due to its prestige as a cultural centre Athens, even after losing political importance, continued to attract Romans with pretensions to learning. The Greek and Latin graffiti on pharaonic monuments and the papyrus (*Tebtunis Papyri*, 1902–38, 1. 33, p. 58 in Bagnall and Derow's edition) detailing instructions to prepare for a Roman senator's visit to the Fayum prove that in Roman Egypt sightseeing had come into its own. Memphis and the Fayum, Thebes, and the Valley of the Kings were popular destinations. On the Nile the Ptolemies employed great luxurious houseboats known as *thalamegi*. With the growing popularity of Panhellenic sanctuaries and the growth of academically prestigious centres, travel for spiritual and intellectual purposes must have become more common; in any case, sightseeing received monumental conceptualization in the idea of the seven wonders of the world. These consisted of the greatest achievements of ancient technology, architecture, and art known to Greek and Roman writers, which were visited during the Hellenistic age and remained the most famous attractions of the Roman world. The list first appeared around 130 BC in a poem by Antipater of Sidon included in the *Greek Anthology*, and a treatise on the subject (probably from the time of the Roman empire) has been attributed to the engineer Philo of Byzantium (*fl.* 146 BC). The canon originally consisted of the pyramids of Giza in Egypt, the city walls of Babylon, the hanging gardens of Babylon, the temple of Artemis at Ephesus, the statue of Zeus at Olympia, the Mausoleum at Hallicarnassus, and the colossus of Rhodes. Listings from Pliny's time onwards generally substitute the Pharos lighthouse at Alexandria for the city walls of Babylon.

One of the earliest Greeks known to have gone abroad (at least ostensibly) for the purpose of seeing the world was the Athenian statesman and poet Solon (*c.*640–*c.*558 BC). Although he belonged to an aristocratic family, he was poor in his young days and travelled as a merchant to enrich himself. But after promulgating his laws he travelled to Egypt and Lydia as a tourist (Herodotus, 1. 30). Herodotus (*c.*480–*c.*425 BC) himself travelled widely in order to gather material for his *Histories*. He was intrigued by the customs of Egypt, where nothing was done as in Greece. His theme was the conflict between the Greeks and the Persians, and he personally visited many of the regions that made up the Persian empire. He was preceded in this respect by the geographer Hecataeus of Miletus (*fl.* *c.*500 BC) who compiled a book entitled *Journey round the World* (*Periodos Ges*), a sort of itinerary, based partly on his own travels, in which he described countries, their inhabitants and customs, animals, and curiosities, and included local fables. A map (which may have been an improvement on an earlier one by Anaximenes) was appended to it. The authenticity of this book, which survives only in fragments, has sometimes been questioned, but is now generally accepted. Fragmentary also is the descriptive work *On the Cities in Greece* by Heraclides Criticus of the 3rd century BC (ed. F. Pfister, 1951). The Roman elite, and above all emperors, pursued travel as a pastime. Hadrian (AD 117–38), a Hellenist who spoke Greek better than Latin, travelled in all the provinces, and built at Tivoli near Rome a vast villa in which the finest buildings he had seen on his travels were reproduced on a small scale.

The only work of ancient travel literature that has come down to us in its entirety is the *Description of Greece* (*Hellados Periegesis*) of Pausanias who, in the middle of the 2nd century AD, travelled throughout the Greek mainland visiting the principal cities (including Athens) and religious sanctuaries such as Olympia and Delphi. His work is a guidebook for tourists, in which he describes in succession various parts of Greece, and he enumerates their most worthy possessions including statues, pictures, tombs, and sanctuaries, giving their etymology, narrating anecdotes, legends, and historical episodes. He related in detail what he saw, and his book is particularly valuable for information about Classical works of art and buildings no longer extant. He also provides much information about customs, religion, and social life in Greece under the Roman empire. He mentions rivers, roads, and villages, curious customs and superstitions, but references to scenery and natural products are rare, and he shows little interest in economic aspects of the country or in its inhabitants.

The extirpation of piracy by Pompey and Augustus and the unification of the Roman empire by the latter gave greater security to travel, though it was still vulnerable to weather conditions, the menace of robbers and brigands, and the many discomforts of ancient transport. The development of travel necessitated the growth of infrastructure, which in its turn encouraged voluntary travel by the provision of support in the form of inns, eating places, etc., though the elite often preferred to rely on reciprocal hospitality. Travelling for pleasure was no doubt enhanced by geographical writing which grew in parallel with mobility in general.



Tourism: a group of visitors view the remains of Mycenae

There was a marked shrinking of the scope of travel in the Byzantine world after the 7th century and the horizons of mobility rarely spread beyond Baghdad in the east, Alexandria in the south, France in the west, and the northern coast of the Black Sea, although we occasionally hear of journeys to India, the Baltic regions, and England. Although Constantinople was visited by travellers from the east and the west (especially after the 11th century), the Byzantines themselves did not travel much. The travellers mainly comprised merchants, officers on government business, ambassadors, and pilgrims and patients visiting shrines of healing. Travel was rarely undertaken for education or pleasure. In the *Lives* of saints we hear of monks travelling to Jerusalem or Rome. Unlike merchants, however, who preferred to travel in groups employing professional ass drivers, these holy men liked to travel by themselves or in pairs. Travellers went on foot or rode horses, mules, or donkeys, or carts drawn by horses and oxen, and the rich were sometimes carried on a litter. But the preferred mode of travel was by ship, which was easier, faster, and cheaper. The travel literature of the period concentrated mainly on Palestine, Egypt, Constantinople, and Rome. It comprised mainly *hodoiporiai* or guidebooks for pilgrims and descriptions of pilgrimages. Their interest was largely directed to religious monuments and relics, sometimes including tales of wonder-working, accounts of diplomatic missions, and the adventures of captives.

In more recent times tourism has been encouraged by changes in aesthetic thought that awakened fresh enthusiasm for the beauties of untamed nature. This change was accompanied by a newfound enthusiasm for antiquity and its ruins and remains. Thus, in 1788 the 72-year-old Abbé Jean-Jacques Barthélémy published, after working on it for 30 years, *Voyage du jeune Anacharsis en Grèce*, which purported to describe the physical appearance, antiquities, institutions, customs, and coins of Greece in the 4th century BC as seen by a Scythian traveller. Much of its success was due to its vividly detailed topographical descriptions, but its author had never set foot in Greece. The clear and intense sunlight of Greece was one of the favourite topics of the numerous visitors to the country in the 19th century who recorded their experiences in an unprecedented proliferation of travel memoirs.

This romantic sensibility stimulated the craving for viewing and sightseeing that is the prerequisite for the evolution of modern tourism. Thanks to the industrial revolution long-distance travel has become comfortable and attractive through safer and faster modes of transport on both land and sea, and Greece and the Greek islands are among today's most popular holiday resorts and centres of tourism.

Tourism has benefited many of Greece's industries, chief among them being the service industry. Since the 1950s many hotels have been built to cater for the rapid increase in tourism. Athens, which is one of the most historic cities in the world,

attracts about 90 per cent of all travellers to the country at some point in their stay. In 1998 nearly 11 million foreign visitors came to Greece, the greatest numbers coming from (in descending order) Germany (some 2.1 million), the United Kingdom, Italy, the Netherlands, and France (nearly half a million). The most popular primary destinations for these visitors were (in descending order) Rhodes (with nearly 9 million), Herakleion, the remaining Dodecanese (excluding Rhodes), Athens, and Corfu (with just over 3 million).

Town Planning

In the Neolithic settlement of Chirokitia on Cyprus (*c.*5500 BC) we encounter one of the first examples of a street. It runs uphill from the bank of the Maroniou river, crosses the settlement, and descends on the opposite side. In modernday Athens archaeologists can trace the path of ancient roads under some of the paved streets. Clearly streets are among the earliest signs of town-planning efforts, underscoring the element of continuity in human settlements. Our experience of the urban environment, however, is not limited to the street layout and its two-dimensional representation on a map. Towns also gain their character from their governing institutions, their civic and religious buildings, their residential quarters, their open spaces, the goods they produce and trade, and their relationship to the surrounding regions.

The plan of ancient Athens, one of the best-studied cities of antiquity, was largely consolidated in the 6th century BC. At that time the Acropolis, once a defensive fort, became dedicated to the deities, and the first administrative buildings were erected in the Agora, the city's political and social centre. By the end of the 6th century BC the Agora defined a quadrilateral area, bounded by magnificent buildings. Other public works were carried out throughout the city, including water and sewer networks. A new road system was established, originating from the Agora. Outside the city there existed three gymnasia, for the military, athletic, and academic training, respectively, of the male youth. Urban legislation, dating also from the 6th century BC, forbade burials inside the city and controlled new building, while the city architect was charged with the maintenance of temples and other public structures. There was, therefore, an already established town-planning tradition that dictated the city's urban affairs, even though the street network remained irregular – "Attic", as it was often called – following closely the site's topography, rather than a prescribed orthogonal geometry. After the destruction of Athens by the Persians in 480 BC the Athenians could have redesigned their city in a regular manner. Instead, they adhered to tradition and rebuilt it along the same lines, this time surrounding it by a new set of walls. The Persians were finally defeated in 479 BC and the Athenian statesman Pericles marked this victory by initiating a completely new building programme on the Acropolis, with the erection of the Parthenon (447–432 BC), the Erechtheum (421–405 BC), and the temple to Athena Nike (427–424 BC), all dedicated to the goddess Athena.

Unlike Athens, the city of Miletus in Asia Minor, which was also destroyed by the Persians, was rebuilt in 479 BC following a regular plan of orthogonal blocks. Possibly the earlier settlement there was also regular. One of its residents, Hippodamus, who was fairly young at the time, might have participated in the city's rebuilding. Later he undertook the design of Piraeus (*c.*460 BC), Thurii in southern Italy (444–43 BC), and, allegedly, of Rhodes in 408–407 BC. In 432 BC the city of Olynthus in Chalcidice was laid out according to the Hippodamian manner. Its grid of parallel and perpendicular streets defined mostly identical building blocks, with some variations among the individual property lots.

Hippodamus is the only architect and planner whose name has come down to us from Greek antiquity. He certainly did not invent regular, orthogonal planning, since there are several earlier examples of regularly planned settlements from around the world. Greek colonial settlements in southern Italy and Asia Minor also adhered to regular, orthogonal planning. According to Aristotle:

> he was the first who, not being actually engaged in the management of public affairs, set himself to inquire what sort of government was best; and he planned a city state, consisting of 10,000 persons, divided into three parts, one consisting of artisans, another of husbandmen, and the third of soldiers; he also divided the lands into three parts, and allotted one to sacred purposes, another to the public, and the third to individuals.
>
> (Politics, 2. 8)

Hippodamus was one of the first urban theorists and philosophers to reflect on the relationship between a society and its

urban environment. His legacy has been associated primarily with regularly planned cities, made up of streets that follow an orthogonal grid.

According to Plutarch, Alexander the Great founded approximately 70 new cities. After his death his successors continued to establish numerous new cities in northern Greece, Egypt, Asia Minor, and Anatolia. They all followed the regular, Hippodamian plan, the simplicity of which facilitated expeditious settlement and land allocation. Thessalonica, an important Hellenistic centre, was founded by Cassander in 316 BC, and laid out in orthogonal building blocks measuring 100 ¥ 50 m. Two major east–west roads, on the site of modern Agiou Dimitriou and Egnatia Streets, traversed the city and led to the city gates. Open public areas contained the ancient agora, a sacred precinct, a stadium, a gymnasium, and a Serapeum. The modern city was redesigned after a catastrophic fire in 1917, but a careful examination of the pre-1917 plan allows us to recognize the Hellenistic grid that ordered it originally. Other prominent Hellenistic cities included Alexandria in Egypt, Pergamum and Priene in Asia Minor, and Damascus, Palmyra, and Dura Europus in modern Syria.

We can also gather significant information on the town-planning practices of the Hellenistic period from *De Architectura*, the only surviving architectural treatise from antiquity. Written by the Roman architect Vitruvius (*c.*90–*c.*20 BC), it makes reference to famous Greek architects and their building methods. Vitruvius outlined site considerations for a new city: healthy location, moderate climate, protection from hot winds, and examination of the animals living on the site. "I cannot too strongly insist upon the need of a return to the method of old times", he wrote. "Our ancestors, when about to build a town or an army post, sacrificed some of the cattle that were wont to feed on the site proposed and examined their livers" (*De Architectura*, 1. 4).

After Greece became a Roman province in 146 BC, some of its cities became the beneficiaries of imperial building programmes, while others fell into oblivion. In Athens under Julius Caesar and Augustus the Roman Agora and the Library of Hadrian – both structures located east of the ancient Greek Agora – were erected. Hadrian, the philosopher-emperor (AD 117–38), endowed Athens with a number of buildings and laid the foundations for a new city, Hadrianopolis, on the site of the modern National Garden, Zappeion, and Constitution Square. As a sign of gratitude, the Athenians erected a dedicatory triumphal arch that marked the city of Theseus, on one side, and the city of Hadrian, on the other side. Roman town planning was also based on an orthogonal grid, punctuated by the *cardo* and *decumanus*, the two main streets meeting at right angles at the Roman forum. Thessalonica, which retained its Hellenistic grid, enjoyed a building boom in the years of the Antonines (end of the 2nd century AD), as is evident from the Roman forum, the stoa of the Incantadas, the exedra, and other epigraphic evidence. Also significant is the imperial complex of Galerius Maximianus, built around AD 305, in the southeastern part of the Roman city. It consists of the Rotunda, the arch of Galerius, the palace, the octagon building, and the hippodrome. The north–south axis of the complex follows the orientation of the already established street network.

During the Byzantine era most cities preserved their earlier street network and continued to maintain their public buildings, often adding new structures that included aqueducts, cisterns, baths, hospitals, and churches. New defensive city walls were erected, protecting not only the urban but also the rural population in case of enemy attacks. The ancient Greek gymnasia, stadia, and theatres were gradually replaced by the hippodrome. Used for race tracks but also for political meetings and rallies, the hippodrome came to replace the ancient Greek agora. Eventually, the singular focus of the ancient agora was superseded by the multiple focal points of the neighbourhood, the parish churches. Parishes became administrative divisions that were preserved in the subsequent Ottoman period and are in effect to this day.

Important Byzantine urban centres such as Thessalonica maintained their significance under Ottoman rule. Although the street network was not altered, cities acquired an Ottoman physiognomy with the addition of new religious and civic buildings. The outlines of the minarets and the prominently positioned mosques signalled to both visitors and residents the presence of a new political and religious power. Baths, khans, caravanserais, poorhouses, fountains, and coffee shops brought together the diverse population and forged a common lifestyle among them. Travellers during the Ottoman period were often unable to distinguish between the houses of Christian and Muslim inhabitants. Travelling building groups were responsible for the most complicated structures – bridges, inns, etc. These groups often worked throughout the empire and adapted their building vocabulary to regional practices, working for both Christian and Muslim patrons.

The War of Independence (1821–27) and subsequent formation of the modern Greek kingdom in 1833 marked a break with the existing conditions. Originally, the new kingdom did not contain any of the major urban centres of the Greek world, namely Thessalonica, Ioannina, Constantinople, Smyrna, and Alexandria. The liberated territory was primarily agrarian, none of its small towns and villages containing more than 15,000 inhabitants. Following the destruction of the war, many of these settlements had been ruined or abandoned, the population seeking refuge in the countryside. One of the main intentions of the 19th-century administrations was the establishment of a unified, rational, urban network throughout the country, initiated by the capital and comparable to prevailing western models. Newly imposed grid lines sought to erase most historical particularities of existing towns and villages that had developed along irregular street systems. Planning legislation also aimed at establishing homogeneity among the rebuilt or newly built towns and villages. The territorial expansions of the state in 1864 and 1881 offered further opportunities for regularized town-planning projects, while generous contributions from wealthy Greeks of the diaspora endowed the capital and other cities with new and imposing civic buildings. By the end of the 19th century more than 170 plans were approved for the foundation of new towns and the restructuring of existing ones. Planning alone, however, did not guarantee a town's economic and cultural prominence. The cities that flourished the most were well-established commercial centres such as Piraeus, Athens, Patras, and Hermoupolis.

In the 20th century the borders of Greece expanded to incorporate Macedonia, western Thrace, and the Dodecanese,

while its population grew dramatically after the arrival of 1.2 million Greek refugees, mainly from Asia Minor. The urgent needs for housing and accommodation dictated the state's planning efforts, while the powerful post-1960s wave of urbanization tested the state's ability to control and direct future growth. The issues facing Greek planners today are global, rather than regional or national. Cities and towns have to accommodate local, immigrant, and transient populations, balance the needs of economic growth with the protection of the natural and cultural environments, and pursue the goals of a unified Europe while showing respect for local histories, traditions, and aspirations.

Trade

Trade has always played an important role in the economic and social life of Greece. The earliest evidence for some kind of formal trade (both national and international) comes from the Bronze Age, when the Minoans and the Mycenaeans were interacting with Asia Minor, Cyprus, the Levant, Egypt, and Italy. This is mainly attested by several exotic materials found on Crete and the Greek mainland and by Aegean pottery found in the areas mentioned above. In addition, there are numerous references in Egyptian 18th-Dynasty sources to "Keftiu", which appears to be the equivalent of Caphtor and to be associated with Crete and the Aegean. Whether these exchanges were palace-administered or "free-enterprise" is not easy to say. The Linear B tablets (in the Mycenaean script) do not even mention the word "trade" but the shipwrecks of Ulu Burun and Cape Gelidonya (off the Turkish coast) indicate that some sort of free entrepreneurs were "tramping" from port to port, making various goods available to Greeks, Cypriots, Syrio-Palestinians, and Egyptians. Both the Minoans and the Mycenaeans mainly imported luxury goods such as gold, ivory, ostrich eggs, and lapis lazuli, but also copper, which was very important for them.

After the fall of the Mycenaean civilization around 1200 BC these exchanges did not cease completely, but became less organized than previously. The period from 1200 to 800 BC, which is widely known as the Greek Dark Ages, is considered as a time of poverty, isolation, and illiteracy. One would therefore expect a complete breakdown of such exchanges. The sites of Lefkandi in Euboea and Knossos in Crete, however, have yielded large numbers of high-value Near Eastern imports such as gold jewellery and ivory objects, indicating frequent contacts with the eastern Mediterranean.

It is not a coincidence that the Euboeans were the first Greeks to establish colonies in the west (such as Pithekoussai) and to participate in the development of multinational emporia in the east (Al Mina) during the 8th century BC. The commodities most sought after in the west were metals – iron, copper, and tin. Soon other Greek cities, such as Corinth, Rhodes, and Chios, founded colonies in the west (mainly in southern Italy and Sicily). These colonies, although politically independent, still kept close trade links with their mother city.

By 600 BC Greek trade was flourishing, mainly due to the establishment of permanent trading posts in Egypt (Naucratis), the Levant, and Etruria. In Greece some of the most important trading cities were Corinth, Megara, and the island of Aegina. It was during this time that Athens started to develop as a major commercial centre. The distribution of black-figure ware is the clearest indication of the growth of Athenian trade. In the period 560–520 BC Attic pottery reached most of the Aegean islands, Asia Minor, Cyprus, the coasts of the Black Sea, Egypt, southern Italy, Sicily, and southern France. The most important Athenian import was corn.

The conquest of the east by Alexander the Great in the 4th century BC widened the field of operation open to Greek trade. His successors carried exploration even further and we see, for example, the Seleucids securing the route to India and the Ptolemies encouraging the development of the trade route around southern Arabia. The most traded goods were grain from Egypt and the Crimea, silk from China, gold from Nubia, silver from Asia Minor and Iberia, wine from north Syria, and slaves. Most of our information about trade patterns during the Hellenistic period comes from the distribution of large pottery containers known as amphorae which survive in huge numbers and whose handles used to be stamped with a state's symbol. Many of them are Rhodian and are found in Alexandria. From this we can infer that Rhodes was a major exporter of liquids, with Alexandria being a major recipient.

By the 2nd century BC Delos had become one of the most important commercial centres, especially after 166 BC when the Romans made it a free port. Unfortunately, the most traded commodity was slaves, something that attracted large numbers of Roman businessmen there. It is said that tens of thousands of slaves could pass through Delos in a single day.

During the Byzantine era trade increased. Few cities have enjoyed so magnificent a commercial site as the capital of the empire, Constantinople, located on the sea channel between the Aegean and the Black Sea and the land bridge between

Europe and Asia. From the earliest years of the Byzantine empire most of its emperors took a keen interest in trade. Especially from the 5th century onwards, emperors such as Anastasius and Justinian managed to gain control of the most sensitive areas for trade near the Red Sea. By the 6th century Byzantium had become the principal intermediary between east and west. The main trade goods were silk from China, aloes, cloves, and sandalwood from Indo-China, pepper from Calliara, various herbs from India, and precious stones from Sri Lanka. It was the trade in silk, however, that made the Byzantine empire so wealthy. All these goods arrived at Constantinople both by land and by sea. The land route passed through Persia and the sea route through Sri Lanka. Most of the goods were carried by Abyssinian ships to the Red Sea, and from there by imperial ships to the Byzantine customs station at Jotabe near Suez.

In the 9th and 10th centuries Byzantine trade was at its height. Far Eastern and Indian goods continued to reach Constantinople in large quantities. At the same time, trade with the north started to develop. Furs, dried fish, amber, and slaves were the main imports from Russia and central Europe. In the west Bari was the principal Byzantine trading post. Gradually, however, the Italian merchant fleets took over, and by the end of the 10th century the Adriatic was in the hands of the Venetians.

The 11th century marked the beginning of the decline of Byzantine trade. The Seljuks conquered most of Asia Minor, destroying the organization and infrastructure of the imperial commerce in the area. Norman invaders captured important trade centres such as Corinth and Thebes and carried off silkworms to Italy, breaking the Byzantine monopoly. Finally, the crusades changed the trade routes of the east, to the detriment of Constantinople. Goods no longer travelled through the Byzantine capital but were shipped at the ports of Latin Syria and carried by the Italians directly to the west, avoiding the customs dues of the empire. After that, Byzantine trade never managed to recover.

After the fall of Constantinople in 1453 and for the next two centuries Greek merchants mostly interacted with central Europe and especially Austria, Hungary, Serbia, and Romania. During the 16th century the most traded goods were cotton, wine, and tobacco, which were mainly distributed by the Macedonian traders located in Budapest and Temesvar. This Greek presence in central Europe had some very important implications for the Greek economy. The inflow of money from these traders back to their places of origin stimulated the underdeveloped mountainous areas of the Greek mainland, and created opportunities for further development. For example, in areas such as Epirus and western Macedonia, small cities started to develop that gradually became commercial and cultural centres.

For the 18th century most of the information available to us comes from the French archives. The most common Greek exports were agricultural products and especially grain and cotton from the Peloponnese and Crete. Imports consisted of industrial products mainly coming from western Europe, food supplies from Russia, and wax from Romania.

In the 19th century and during the reign of king Otho foreign trade flourished. According to Thiersch (quoted in Christopoulos, 1970–79), in 1832 Greece had a merchant fleet consisting of 2000 ships and about 30,000 families working in the business. The main trade centres were Nauplia and the islands of Spetsae, Syros, and Hydra. In the years 1855–60 a new increase in trade occurred. Corinthian raisins were the primary export, with Britain being the main recipient. Greece imported iron from Britain, timber from Austria, cereals from Turkey, and coffee from France. From 1858 onwards it started to export large quantities of wine and olive oil, mainly to Russia, Austria, and Turkey.

Greek trade experienced some growth during 1906–07, a slight fall during 1908–09, and a new rise in 1910. At the same time, the Greek merchant fleet acquired large numbers of steamships. In 1915 it consisted of 475 steamships with a capacity of about 893,650 tons; it was the 11th largest fleet in the world with 2 per cent of world tonnage. During World War I and despite the great difficulties, the Greek merchant fleet not only survived but produced huge profits. It is estimated that in a normal year the Greek merchant fleet produced profits of about 30 million francs (the common currency of Greek trade at the time). In the first year and a half of the war profits rose to about 200 million francs. After the end of the war, Greek trade continued to grow both in quantity and in value. The main exports were tobacco, raisins, olive oil, and wine which accounted for 75 per cent of the total exports during 1919–23. The main destinations were Britain, the United States, and Germany. Imports consisted of cereals, linen, coal, and metals, with the United States being the main supplier.

During the early 1930s a new trade policy was implemented in Greece. Its basic principal was that imports should be paid for by the profits from exports. Under this system, known as "clearing", Greece imported goods only from those countries that accepted Greek products of the same value. By 1936 76.5 per cent of Greek trade was carried out in this way. The period from 1940 to 1950 was very problematic for Greek trade due to World War II and the Civil War that followed. By the early 1960s, however, the total volume of Greek foreign trade had increased by more than 50 per cent over that of the 1930s. Exports still consisted mainly of agricultural products (about 81 per cent of all exports in 1963) and imports mainly of industrial products such as machinery and transportation equipment. During that period Greece was heavily dependent on eastern Europe for trade expansion.

The acceptance of Greece into the European Economic Community (EEC) in 1981 offered significant economic improvement through wider markets for Greek products. Exports now included textiles, clothing, fruits, and vegetables, primarily going to Germany, Italy, and France. Imports included crude petroleum, ships and boats, and chemicals, mainly from Germany, Japan, Italy, and Saudi Arabia. Since the early 1970s Greek-owned merchant shipping has ranked first in the world fleet in terms of tonnage, a distinction it still holds today with 16 per cent of world tonnage.

Tragedy

Greek tragedy matured in Attica in the 5th century BC. With one possible exception, all of the surviving plays date from this time and were written by Athenians for competitive performance at dramatic festivals, notably the City (or Great) Dionysia (from at least the end of the 6th century BC) and the Lenaea (from the 430s BC). There were also performances at the Rural Dionysia. Productions were not confined to Attica and there are traditions that earlier forms of tragedy originated in the northern Peloponnese. The main festivals were important civic and political occasions with a strong religious framework expressed in sacrifice, ritual, and processions. There were performances of dithyramb and comedy as well as tragedy. The tragedy competition was part of the Athenian culture of public display, also evidenced in the gymnasium, law courts, and Assembly. Each contestant entered a trilogy followed by a satyr play. Judges were selected by lot from across the tribes and their votes were delivered by secret ballot. Victories were listed in public records (*didaskalia*). These records, although fragmentary, help with dating.

The origins of tragedy are somewhat obscure. Aristotle (*Poetics*) put forward an analysis that has strongly influenced subsequent debate. He suggested that early tragedy was improvised by the leading performers of the dithyramb, a choral song and dance in honour of Dionysus, and that it was also influenced by the satyr play. Aristotle also gives an account of 5th-century BC developments affecting staging, the balance between choral and spoken words, and the increase in the number of actors from two to three. He emphasized the concept of the tragic hero and argued that tragedy inspired in the audience the emotions of pity (for suffering that was largely undeserved) and fear (because the hero represented the human condition). As a result, the audience would experience catharsis or relief of these emotions, tempered by a sense of satisfaction at recognizing and learning about moral and spiritual truths.

This combination of powerful emotions and the political context of popular democracy was thought by Plato to be dangerous. In the *Republic* he associated tragedy with his criticisms of poetry, especially Homer. Drama and poetry were to be banished from education in Plato's ideal state because he thought that they were concerned with representation rather than reality. He held that their appeal to the imagination and their portrayal of the extremes of divine and human behaviour were morally and politically subversive.

Greek tragedy is a prime example of the theatre of convention. These conventions cover staging, subject matter, and form. The main contextual conventions are that the plays were staged in large, open-air theatres as part of a performance culture embedded in civic and religious life. All actors were male. The City Dionysia had a tradition of competition by choruses. The financing of the chorus (including its maintenance and training) was undertaken as a liturgy (or public service) by a wealthy citizen, appointed by the eponymous archon who also chose the three tragedians who were to be "granted a chorus". The visual nature of the theatre spectacle, with its large audiences (perhaps in excess of 14,000 at the major festivals), had considerable impact on performance styles, especially masks, costume, gesture, and movement. The archaeological evidence for the orchestra, the part of the theatre where the chorus performed, between the stage and the audience, dates from the 4th-century BC theatre at Epidaurus. In the 5th century BC the stage and its buildings (*skene*) were probably wooden with steps down to the orchestra. Stage machinery for tragedy included the *ekkyklema*, a wheeled platform for set-piece displays (such as Sophocles' Ajax surrounded by the carcasses of the animals he had slaughtered in mistake for the Greek leaders). The *mechane*, a crane, enabled "flying" entrances and exits of the gods. Literary sources and vase paintings suggest that masks had stock features according to the character represented. Taken together, masks and the size of the theatre precluded the use of facial expression, thus putting more emphasis on grand gesture, costume, music, and choreography, as well as on the rhetorical force of the dialogue. Masks also facilitated the doubling of roles.

The subject matter of tragedy was also bound by conventions. With one exception all the surviving plays are based on stories from myth. These were part of the common culture of Greece, expressing values often shaped by the Homeric poems and transmitted by the rhapsodes' performance of epic, particularized in vase painting and sculpture, and given local associations through cult. However, these myths, with their stories about the relationships between gods and heroes and their dilemmas of rivalry, revenge, murder, and betrayal in peace and war, were not presented by tragedians as fixed icons of the past. They were reworked and reinterpreted and, because of their indeterminate historical provenance, they provided a distanced but culturally influential setting for the exploration of suffering and the examination of moral and religious imperatives. The selection of particular myths and contrasts in the ways in which they were treated provide important insights into changes in attitude and artistic aims as well as a commentary on Greek perceptions of the relation of myth to the contemporary world and its problems. The surviving exception (others are lost) to the convention of mythological setting is Aeschylus' *Persians* (472 BC), which depicts the aftermath to the Persian defeat by the Greeks at the Battle of Salamis, although the Persian setting maintains the remoteness from Athens that is a feature of most tragedy. A striking feature of tragedy, created in a society that subordinated and marginalized women, is that a significant proportion of the protagonists are female (e.g. Antigone, Medea, Hecuba) and that issues of gender and power are presented from a variety of perspectives.

The formal conventions within which the plays were constructed also served to distance tragedy from over-ready identification with everyday life. Of these conventions, the most important are the chorus, the various types of verbal

Tragedy: a performance of Euripides' *Suppliant Women* at one of the Delphic Festivals staged by Angelos Sikelianos and Eva Palmer, late 1920s

exchange, and the lament. The chorus consisted of 12 or 15 singers and dancers who performed in the orchestra, providing for the audience a collective mediation of the moral and religious implications of the action of the tragedy. Their entry song (*parodos*) was supplemented by lyric exchanges with the actors and by the choral ode (*stasimon*). Reconstruction of the music and dance in tragedy is speculative and so presentation of the chorus has been difficult for modern productions, especially those that take place in a commercial or studio theatre. There were normally five choral performances in a tragedy and the episodes between these were the focus of sung or spoken exchanges. These might include the narration, often in a messenger speech, of vital events, including violence, which by convention took place off stage. Even more important was the formal debate or *agon* between two main characters. This usually included the dramatic device of *stichomythia*, in which actors spoke alternate lines or pairs of lines. Conventionally, a sung lament (*kommos*) expressed the pent-up emotions produced by the dramatic tension and the suffering of the hero. The ways in which these formal conventions are refined or varied provide significant insights into the work of the different writers.

Major parts of the work of three 5th-century BC tragedians have been preserved, while others are represented only by fragments. Aeschylus has seven plays extant and records indicate that he gained 13 victories. Sophocles wrote more than 120 plays and won at least 20 victories, 18 of them at the City Dionysia. Seven plays survive. Euripides had a less consistent record, with four victories at the Dionysia. He wrote about 90 plays, of which 19 survive.

The reception and transmission of tragedy in antiquity from the 4th century BC onwards shaped the responses of later ages. Fifth-century plays were performed and read in the 4th, when there was legislation to prevent wholesale changes to the text. In 386 BC a competition for revivals was established at the City Dionysia, but the 4th century BC also included important new work, and tragedians such as Archestratus, Astydamas, Carcinus, Chaeremon, and Theodectes are either mentioned by Aristotle or were themselves the subject of revivals in the 3rd century BC. The "family" archives of theatre practitioners were a significant means of preserving previously unperformed plays and an influential feature of the widespread demand for performance was the development of powerful guilds for actors (Craftsmen or Artists of Dionysus) with their own institutions and privileges.

Adding to the early demand for Athenian tragedy in Sicily and Macedonia, Alexander the Great's policy of establishing Greek cities in the east both spread Hellenic culture and exposed it to the contributions of non-Greeks. At Alexandria in Egypt the process of canon formation intensified from the 3rd century BC onwards with the collection together of selected plays of Aeschylus, Sophocles, and Euripides and the addition of commentaries. Demand for the availability of texts for education may have helped to make this a self-replicating operation. Greek tragedy also entered the culture of the Roman Republic through the plays of Ennius, Accius, and Pacuvius. In

the 1st century AD Seneca's tragedies, nine of which survive, violently orchestrated the situations and some of the formal elements of the Greek corpus. Senecan tragedy strongly influenced Renaissance theatre, especially in Italy, France, and England.

Once the Roman empire was Christianized and the centre of power shifted to Byzantium, tragedy was again regarded as dangerous, because it was a pagan art form and part of a theatre culture that the Church regarded as obscene (since it involved cross-dressing) and blasphemous (since it invoked the name of Dionysus). State funding for the traditional dramatic festivals was withdrawn and drama exiled to the melange of popular events in the Hippodrome. The alternative to suppression was appropriation and some features of the language and rhetoric of tragedy were absorbed into political and religious life. There was, however, continued artistic interaction between the tradition of tragedy and new work. For example, an undated Byzantine tragedy *Christos Paschon* drew heavily on Euripides, particularly the *Bacchae*, in its exploration of the suffering of Christ.

In Greece itself cultural activities that attracted crowds were forbidden during the 400-year period of Turkish domination after the fall of Constantinople, but tragedy continued to be performed in the Greek communities on the Danube and in Bucharest, Odessa, and Jassy, cities controlled by Russia. The ancient theatre became an icon of Hellenic identity and a symbol of the desire for freedom, notably in the Hellenic Carta, designed by Rigas Pherraios (1797) at a time when translations of tragedy were being widely circulated among Greeks, especially in the diaspora. More radically, the *Philiki Hetaireia*, which promoted rebellion against the Turks, regarded the establishment of a Greek theatre as a means of ensuring the translation of historical and cultural awareness into revolutionary action. After Greek independence (1821) the association between Greek tragedy and freedom influenced drama and poetry in other literatures, including the work of Byron and Shelley.

In 1867 the (Roman) theatre of Herodes Atticus in Athens was used for a revival of *Antigone*, performed by students with music by Mendelssohn, and in the early 20th century Angelos Sikelianos and his wife Eva Palmer developed the "Delphic Idea". This aimed at establishing at the *omphalos* (the navel of the earth at Delphi) a university based on a spiritual and communal ideal of world peace. A festival was held in 1927 at which tragedy was performed, together with athletics and folk dancing. Part of the performance of Aeschylus' *Prometheus Bound* has been preserved on film. In 1930 another festival was held, which also included Aeschylus' *Suppliants*. There was some criticism from the radical press that such festivals were inaccessible to the public and encouraged cultural nostalgia, but the staging of the plays stimulated debate about performance styles and there were further productions at Constantinople and Alexandria.

Regular productions of tragedy were also instituted by the Greek National Theatre (founded 1930), which in 1938 performed Sophocles' *Electra* at Epidaurus, where a festival was instituted in 1954. The Piraiko Theatre and the Theatro Technis also established distinct traditions in the performance of tragedy, as did the National Theatre of Northern Greece and the innovative Amphi-Theatro. More than 20 ancient theatres have been brought into use, with regular productions at the Athens and Epidaurus festivals.

Discussion and experiment were further encouraged by the European Cultural Centre at Delphi, founded in 1964 to encourage cultural exchange among all nations. In recent years performances of tragedy in Greece have included *Antigone* by an Inuit company, *Oedipus Tyrannus* by the Central Academy of Drama of Beijing as well as Noh- and Kabuki-inspired productions directed by Tadaski Suzuki (Japan), and the Epidaurus Festival performance of Aeschylus' *Oresteia*, directed by Peter Hall and translated into English by Tony Harrison.

Following the Sikelianos *Prometheus in Chains*, film has presented tragedy in both realistic and experimental forms, using myth as a catalyst for invention, as did the tragedians. Work by Greek artists includes *Electra* (Sophocles, directed by Zarpas, 1962), *Antigone* (Tzavellas, 1961), *Electra* (Euripides, directed by Cacoyannis, 1961), *Orestes* (Fotopolous, 1971, shot in Mani), *Iphigenia* (Cacoyannis, 1976), *Phaedra* (Dassin, 1961, joint USA/Greece production), the experimental *Prometheus Second Person Singular* (Costas Ferris, 1975), and *A Dream of Passion*, based on Volonakis' modern Greek version of *Medea* (Dassin, 1978, Swiss/Greek production). Cacoyannis also made a version in English of *The Trojan Women* in Spain (1971) while the Junta was in power in Greece and this was perhaps influenced by his staging of the play, which had more than 650 performances. In 1994 Nikos Koundouros directed *Antigone*, subtitled "A cry for peace", in no man's land between northern Greece and the former Yugoslavia, with a backdrop of troops and armoured weapons.

In contrast to the fear expressed by some modernist theatre practitioners, 20th-century work on ancient tragedy has not led to a mood of nostalgia and cultural fossilization. The themes and ethos of tragedy have continued to figure in novels, poetry, and drama, notably in the work of Nikos Kazantzakis, where they are mediated both by Homer and by Byzantine traditions. Such works, together with modern films, versions, and performances, have explored, both aesthetically and politically, that theme of reinterpretation of myth in the context of debate about the present with which the ancient tragedians were themselves engaged.

Transhumance

Transhumance is a form of herding organized around the movement of livestock between lowland pastures in the winter and mountain pastures in the summer. Herding of this type is a recurring feature of Greek life because year-round maintenance of substantial numbers of animals in either the plains or the mountains of Greece is difficult. The plains must be avoided during the summer months because a nearly complete lack of rainfall makes it impossible to find forage. The mountains must be avoided during the winter months because deep snows and extreme cold make it impossible for flocks to graze. Greek transhumants, drawn by relatively abundant vegetation and mild temperatures, spend the months from October to April in various coastal plains. As summer approaches, they move to upland areas where melting snow produces rich forage. Greek transhumants rely almost exclusively on sheep and goats; the nimbleness and size of these animals make them much better suited to the rough topography of the country than cattle.

Transhumance can take one of two very different forms. In some cases it involves nothing more than individual shepherds migrating with their flocks. Typically such shepherds are employed by large landowners who provide the animals and grazing lands. In other cases transhumance is a form of societal organization in which large, independent family groups migrate with and organize their lives around the care of their flocks.

While the latter form of transhumance is the more common and probably the more ancient, the earliest documented instance of transhumance in Greece is an example of the former. During the Mycenaean period (*c.*1600–1100 BC) Greece was divided into a number of kingdoms, each with a ruler and an elaborate bureaucracy. These rulers controlled very large numbers of sheep that were assigned, flock by flock, to individual shepherds. In return for sustenance provided by the royal household, the shepherd was responsible for tending the animals assigned to him and for producing a specified amount of wool each year. Extant records indicate that the ruler of Crete owned 80,000 sheep which produced nearly 68,000 kg of wool each year.

This system of transhumance broke down with the collapse of Mycenaean civilization. The highly unsettled conditions that ensued were an ideal environment for group transhumance. The ability of transhumants to move out of the way of danger was an important aid to survival in a period of societal disintegration. In addition, the steep decline in population levels and in agricultural activity that marked the post-Mycenaean period made extensive areas of Greece newly available as pasture land. Animal bones from this period found at the site of Nichoria in the southwest Peloponnese show that the composition of herds differed from that found in the Mycenaean period in such a way as to increase the production of meat and milk and at the expense of wool production. This change reflects the transition from individual transhumants supported by the Mycenaean state to group transhumance and direct reliance on flocks for sustenance.

While the collapse of society and population levels encouraged transhumance in the years immediately after 1100 BC, the gradual restoration of society and rise in population levels that took place in the 8th and 7th centuries BC did the reverse. In settled conditions the advantages of mobility were considerably lessened. More importantly, the fact that herding, relative to agriculture, is a non-intensive land-use pattern that is capable of supporting a limited number of people meant that as population densities in Greece increased, so did the importance of agriculture. Even so, transhumance continued to be practised throughout antiquity. Sophocles' *Oedipus Tyrannus* (lines 1133–40), for instance, includes a scene involving two shepherds who spent summers with their flocks on Mount Cithaeron and then returned to lowland pastures in the winter.

Group transhumance returned to prominence during the confused period of the 12th–15th centuries AD which was brought about by the gradual collapse of Byzantine rule in Greece. Albanians and Vlachs moved into Greece from the north, bringing their families and flocks with them, displacing though not entirely destroying native Greek transhumants in the process. One of the more enduring results of this migration was the division of transhumants in Greece into two groups, Vlachs and Sarakatsans. After this period and right up to the present day, ethnic Vlachs who speak their own language and who descend directly from these migrants have remained sepa-

rate and distinct from the Greek-speaking Sarakatsans, who are descended from the native transhumants resident in Greece as early as the Byzantine period. The Albanian and Vlach migrants found a depopulated countryside ideal for transhumant herding. A 14th-century document describes a group of Albanian transhumants who wintered in the coastal plain of Elis (northwestern Peloponnese) because the area "had good grazing and was deserted by men" (cited and translated by Hammond, p. 61).

The imposition of Turkish rule in the 15th century did not bring an end to group transhumance because much of Greece was divided into large estates under the control of powerful Turks or of monasteries. These estates were not as a rule intensively cultivated and significant areas were thus available as pasturage, which was rented out on a seasonal basis. This pattern continued even after Greece achieved independence from the Ottoman empire. Throughout the 19th century most of the large estates continued in existence despite changes in ownership brought about by the departure of the Turks. Group transhumance continued much as before.

This situation was drastically altered as a result of the population exchange undertaken by Greece and Turkey beginning in 1922. The Greek government settled the people arriving from Turkey on smallholdings carved out of the large blocks of land mentioned above. This made winter grazing lands very much more difficult to find and resulted in a significant decrease in the number of transhumants active in Greece. In order to ameliorate the situation, a law of 1930 gave shepherds the right of protected leasing of grazing land. Under the provisions of this law, grazing leases had to be offered for yearly renewal at prices set by the government. Further relief was given to transhumants in 1938 when legislation permitted them to register as official residents of the mountain villages where they spent their summers. Registration brought with it the right of free access to public grazing lands held by these villages.

Despite these measures, during the 20th century there has been a continued marked decline in the numbers of transhumants in Greece. Most transhumants are now confined to the less densely settled, more mountainous regions of Greece such as Epirus. Increases in settlement density and the advent of heavy motor traffic have made migration across the countryside increasingly difficult. The steady economic development that Greece has experienced since World War II presents a real and growing threat to the continued existence of transhumance within its borders.

Translation from Greek

Translations, together with adaptations and imitations, have been an important vehicle in the diffusion of Greek literature and thought. In certain instances, translations from the Greek represent the earliest examples of written literature. This is the case in particular with the Christian literature in Armenian and Georgian, where translations from Greek and Syriac played a formative role. Similarly, Roman literature is believed to have begun in 240 BC when a Greek schoolmaster named Livius Andronicus translated into Latin a tragedy, a comedy, and an epic, the last being the *Odyssey* which he rendered into Saturnian verse. New Comedy (and possibly Middle Comedy) provided the sources for the earliest literary comedies in Latin, of which we have surviving examples by Plautus and Terence, on whose work we have to depend for our knowledge of many lost works by poets of New Comedy such as Philemon, Diphilus, and Menander. The plays of Seneca are the only surviving examples of Latin adaptations from the great Classical Greek tragedians. Latin poets did sometimes translate Greek lyrics, Catullus 51 being a well-known example; but no one today would wholeheartedly agree with Aulus Gellius who held that Virgil in his *Eclogues*, *Georgics*, and *Aeneid* translated Theocritus, Hesiod, and Homer respectively, his debt to these poets being best described as one of inspiration and imitation.

Most educated Romans were bilingual, and many of them endeavoured to make the literature and learning of the Greeks available to Romans by translation and adaptation of Greek works into Latin. Thus, Cicero translated the *Phaenomena* of Aratus, a Hellenistic didactic poem on astronomy (this work was translated once again in the 7th century). But the Romans, and especially their poets, were quite conscious of the limitations of the Latin language in matching the richness and subtlety of Greek (cf. the complaint of Lucretius in 1. 139 about the poverty of the language).

The Romans conceptualized the process of translation and established the framework and norms which endured in the west until the end of the 18th century. The younger Pliny (*Epistulae*, 8. 9. 1) recommends translation from Greek to Latin and vice versa as an exercise for developing verbal fluency and critical discernment. There was also advice against undue literalism. Horace (*Ars Poetica*, 133–34 tr. Dorsch) says:

> A theme that is familiar can be made your own property as long as you do not waste your time on a hackneyed treatment; nor should you try to render your original word for word like a slavish translator, or in imitating

> another writer plunge yourself into difficulties from which shame, or the rules you have laid down for yourself prevent you from extricating yourself.

On translating from Demosthenes and Aeschines, Cicero's advice is "not the words of the orators". "To explain not word by word but sense by sense", says St Jerome, who produced the Latin Bible known as the Vulgate.

During late antiquity translators into Latin concentrated mainly on science, military exploits, and adventures, and Christian works on theology, hagiography, and ecclesiastical history. Among scientific writings, the *Periegesis* of Dionysius was rendered into Latin by both Rufus Festus Avienus and Priscian. The gynaecological works of Soranus of Ephesus were translated by Mustio during the 6th century. The metrological treatise of Epiphanius of Salamis, written around AD 392, was translated in the 5th or 6th century. The alleged memoirs of Dares of Phrygia (6th century BC) and the story of Apollonius of Tyre are representative of military exploits and adventures. Translations of hagiography began quite early: Athanasius' *Life of St Antony* appeared in Latin as early as AD 373, and the story of *Barlaam and Joasaph* was translated into Latin during the 11th century.

Theology became the main focus of attention from the 9th century onwards. In 824, at the request of Louis the Pious, Erigena translated the Greek manuscript of *The Celestial Hierarchy*, attributed to Dionysius the Areopagite, and was deeply influenced by it. The result was the unofficial establishment in Christian theology of the Neoplatonist picture of a universe evolving or emanating out of God through different stages or degrees of diminishing perfection, and slowly returning through different degrees back into the deity. John Chrysostom and John of Damascus were among the authors translated by Burgundio of Pisa in the 12th century, while Moses of Bergamo translated a treatise attributed to Epiphanius of Salamis and a florilegium on the Trinity.

Greek science and philosophy had so far been rendered into Latin mainly from Arabic versions which were themselves sometimes made from Syriac versions. But the desire for more accurate renderings led to such productions as Aristotle's *Topics*, *Sophistici Elenchi*, and *Posterior Analytics* by one James, known to us only as "a clerk of Venice", at some time before 1128. Eugene "The Emir" of Palermo translated the *Optics* of Ptolemy in 1154, and in 1160 shared in a Latin translation of the *Almagest* directly from the Greek. Before this, Aristippus of Catania had translated (*c.*1156) Diogenes Laertius' *Lives of the Philosophers* as well as Plato's *Meno* and *Phaedo*.

The revival of interest in Greek philosophy that began in the 13th century resulted in Latin renderings of the Aristotelian corpus and its commentaries. Notable in this regard are William of Moerbeke, the Flemish archbishop of Corinth and friend and fellow Dominican of Thomas Aquinas (he also translated works by Hippocrates, Galen, Heron of Alexandria, Proclus, and Archimedes), and the circle of scholars at Lincoln headed by Robert Grosseteste (who also translated works of pseudo-Dionysius the Areopagite and John Argyropoulos), Theodore Gaza, and George of Trebizond (who also translated Plato and some Church Fathers). Several writers including Demosthenes and Plutarch were translated by Nicholas Sekoundinos. These Latin translations exerted a profound influence on developments in grammar and philology, medicine, astronomy, and mathematics as well as theology and philosophy. They enlarged the curriculum of the schools and contributed to the growth of European universities in the 12th and 13th centuries.

The only Latin translation of Homer known to Europe in the 14th century was the inaccurate and prosaic version by Leon Pilatus, a pupil of Barlaam of Calabria and an acquaintance of Bocaccio and Petrarch. Pope Nicholas V commissioned Francesco Filelfo to prepare a fresh translation; but this commission, like that given to Manetti and his aides for a new translation of the Bible, was terminated by the pope's death in 1455. He also made liberal grants for translations of Classical Greek texts: to Lorenzo Valla for Thucydides, to Guarino da Verona for Strabo, to Niccolo Perotti for Polybius, to Poggio Bracciolini for Diodorus Siculus, to Theodore Gaza for Aristotle, to Gianozzo Manetti and George of Trebizond for Cyril, Basil, Gregory of Nazianzus, Gregory of Nyssa, and other patristic texts. Though hurried and imperfect, these Latin translations opened these Greek authors for the first time to students who could not read the originals. In February 1516 the printer Froben brought out Erasmus' critical revision of the Greek New Testament with a new Latin translation and a commentary, and this was reprinted in 1518.

Next in importance to Latin translations in the conveying of Greek ideas to the west are the translations into Arabic. The earliest instances were of Christian origin, and the translations were made mainly through Syriac versions. Here, too, the emphasis was on religious, philosophical, medical, and scientific works. The earliest religious translations were of biblical and liturgical texts whose dating, however, is uncertain, especially whether any of them predate the coming of Islam. Both hagiographical works and the writings of Church Fathers and ascetics came to be translated in the monasteries of southern Palestine by the 9th century. Medical material most probably came initially through Syriac before direct translations from the Greek were made. The case of astronomy and mathematics may have been the same except that the Syriac versions appear to be contemporaneous with the Arabic, being largely the work of Hunayn Ibn Ishaq al-'Ibadi (died 873 or 877) or his school. It does not appear that the translations of Euclid and Ptolemy were made until after the reign of Harun al-Rashid (786–809), so the story that they were suggested to the caliph by Jafar Ibn Barmak as a remedy for the Arabs' inability to understand a version of the Indian *Siddhanta* of Brahmagupta cannot be trusted.

In astronomy and mathematics, where absolute accuracy of terminology was imperative, direct reference to the Greek originals appears to have taken place earlier than in medicine, whose terms, when borrowed from the Greek, suggest a greater degree of Syrian intermediation. The desire for more accurate scientific knowledge led to more careful translations or revision of existing versions, as well as commentaries and original works based on Greek authorities. The best-known translator of Greek scientific works into Arabic is Hunayn Ibn Ishaq al-'Ibadi, whom the caliph al-Mamun placed in charge of the House of Wisdom (*Bayt al-Hikmah*) that he established in 830 at Baghdad at a cost of 200,000 dinars as a scientific academy, an observatory, and a public library. Here he installed a body of translators and paid them from the public treasury in order to foster the preparation and propagation of

translations from Greek scientists. The resulting translations included the greater part of the works of Galen, Hippocrates, Ptolemy, Euclid, Aristotle, and other Greek authorities. The desire for greater accuracy is reflected in the preparation of Syriac translations in addition to the Arabic to replace defective versions already in use. A Syrian Christian named Qusta Ibn Luqa al-Balhakki (*fl. c.*912) translated several works including Hypsicles (later revised by al-Kindi), Theodosius' *Sphaerica* (later revised by Thabit Ibn Qurra), Heron's *Mechanics*, Autolycus, Theophrastus' *Meteora*, Galen's catalogue of his books, and John Philoponus on the *Physics* of Aristotle. He also revised the existing translation of Euclid. Aristotle's *Poetics* was translated by Matta Ibn Yunus al-Qunnai (d. 940). Among the medical and logical works translated by the monophysite logician Abu Zakariya Yahya Ibn Adi al-Mantiqi (d. 974) was the *Prolegomena* of Ammonius and an introduction to Porphyry's *Isagoge*. Thereafter, translation gave way to revisions, commentaries, and expositions.

The literatures of the eastern Christians owed their formation to a large extent to translations of Greek texts into Syriac, Armenian, Georgian, Arabic, Coptic, Ethiopic, and the Slavonic languages. These translations of biblical, theological, and liturgical texts represent the common cultural debt of eastern Christianity to Hellenistic civilization, whose impact transcended linguistic, cultural, and even theological differences and was not confined to religious literature. Thus translations from the Greek works on theology, philosophy, rhetoric, and science not only laid the foundation for Syrian learning in those spheres, but also served as the principal medium for the transmission of Greek thought to the Muslim world. Throughout the Byzantine period Armenian literature was enriched by translations from the Greek. Of particular significance was the impact of the Hellenistic Jewish writers Josephus and Philo, and of the church historians Socrates and Eusebius. Georgian translations have preserved the liturgical traditions associated with Jerusalem that were later subordinated to the Byzantine rite. Since they remained Chalcedonian, the Georgians were in touch with Greek scholars at monastic centres such as Mount Athos (Iviron in particular), Mount Sinai, and the Black Mountain (in the Karakorum near Peshawar in Pakistan).

Because the Slavonic translations made by Cyril and Methodios for their Moravian mission (863–85) have not survived, the earliest examples are those belonging to the Christian period of the first Bulgarian empire (864–971). These were mainly religious in character (biblical, exegetical, homiletic, historical, and liturgical writings as well as hagiography, gnomologia, florilegia, works on canon law, and the like), as were those from the 12th to 15th centuries made in Bulgaria, Serbia, and on Mount Athos (e.g. at Hilandar). Many of these were literal translations, in keeping with the medieval insistence on preserving both the content and the form of the original.

The immense popularity of certain works is indicated by the number of translations into various languages. As examples may be cited the story of *Barlaam and Joasaph*, the fables of Aesop, and the *Alexander Romance*. The last-mentioned work was translated into Armenian and the Slavonic languages.

During the second half of the 16th century a large number of English translations of the classics were made, including Theocritus' *Idylls*, Musaeus' *Hero and Leander*, Epictetus' *Enchiridion*, Aristotle's *Ethics* and *Politics*, Xenophon's *Cyropaedia* and *Oeconomicus*, the speeches of Demosthenes and Isocrates, the histories of Herodotus, Polybius, Diodorus Siculus, Josephus, and Appian, and the novels of Heliodorus and Longus. In 1579 Sir Thomas North translated Plutarch's *Lives* using Amyot's French translation. These translations exerted such an immense influence upon Elizabethan literature that, during the next two centuries, English poetry and prose were fraught with Classical allusions. There were no Greek plays in English for quite some time, however, and Homer had to wait till the verse renderings of George Chapman (1611) and Alexander Pope (*Iliad*, 1715–20; *Odyssey*, 1725–26).

Some recent collections of Classical texts are accompanied by translations into modern languages. Thus, the Budé edition (named after the well-known French humanist Guillaume Budé, 1467–1540) includes a French translation, while the collection known as the Loeb Classical Library, founded in 1912 by the American banker James Loeb, presents the original text with an English translation on opposite pages. Meanwhile, in 1946, under the general editorship of the late E.V. Rieu, the Penguin Classics series was launched with Rieu's own translation of the *Odyssey*. This series has been instrumental in popularizing the Classics among the English-reading public throughout the world by providing highly readable translations at affordable prices.

Translation into Greek

Translation in the west goes as far back as the Septuagint – the translation, in the 3rd century BC, of the Old Testament from the original Hebrew into Greek Koine. Yet, it was only in the last decades of the 20th century that translation practice and theory became objects of systematic enquiry with histories of translation attempting to unearth and organize them into a distinct field of knowledge. Although references to Greece in such works of reconstruction are conspicuously absent, there exists, nevertheless, a long and particularly interesting tradi-

tion of practice and thought regarding translation into Greek; a tradition that brings into focus three distinct yet interrelated contexts where translation constitutes a key issue: Greek Orthodoxy, Greek national identity, and the so-called Language Question. Modern Hellenism's relation to its ancient past, the much-debated question of continuity, and, more generally, the definition of the modern Greek state's national and cultural identity (tradition, religion, educational system, form of government, form of language, etc.) are all issues that, directly or indirectly, translation brings to the fore as Greek translators, at different historical moments, have had to decide whether, what, how, and for whom to translate.

Although by no means an exclusively Greek phenomenon, no other European nation has practised or debated more intensely the category of translation that Roman Jakobson (1959) has termed "intralingual": translation, that is, that brings into contact different phases of the history of a language as opposed to interlingual or translation proper. Intralingual translation in Greece has, traditionally, concerned the rendering of the Classical and biblical texts into a more or less simple katharevousa or into demotic and the existence of various terms to describe this practice – *metaphrasi*, *metagraphi*, *metaglotisi*, *metaphora*, *devteri graphi*, *morphi* – testifies to the different ways of conceiving it. As early on as the first stages of the Tourkokratia, Greek scholars faced the question of whether to adapt the biblical texts to a more accessible form of language, creating, thereby, two opposed traditions. The one, represented by the Greek Orthodox Church, remained hostile to and deeply suspicious of such adaptations maintaining that the original Greek language of the texts was the only language of Orthodoxy, that any form of interference with it was fraught with doctrinal and political dangers – altering the true letter and spirit of the texts and subverting the authority of the Church – and that the Greek vernacular was too poor and vulgar to express the divine meaning of the texts. For the Church hierarchy, translation of the holy scriptures into the spoken language amounted to treason and heresy or, as expressed by Konstantinos Oikonomos, a leading conservative theologian in the first decades of independence, to a futile, damaging, and useless activity. To this day, the Greek Constitution does not recognize any translation of the scriptures that does not have the authorization of the Church. But the very fact that the Greek Constitution is itself written in two versions – katharevousa and demotic – testifies to the importance and still unresolved status of intralingual translation.

In opposition to this ultraconservatism, however, there runs a liberal tradition which goes as far back as 1544, in which year Nikolaos Sophianos printed in Venice his version of pseudo-Plutarch's *Peri Paidon Agoges* in the "common language". The tradition inaugurated by Sophianos began by recognizing translation as a means of making knowledge accessible to all social layers and thus contributing to the construction of the nation – an idea that was to remain a constant throughout this tradition. For Sophianos, compiler of *A Grammar of the Common Language of the Greeks*, concern with translation went hand-in-hand with concern for language and education; just as five centuries later, in 1938, translation, particularly of the ancient texts, was to be seen as a key to the construction of a modern national education and language system by Manolis Triandaphyllidis, author of a *Neoelliniki Grammatiki*, this time in demotic. But even within the Church hierarchy there have been enlightened figures who defended (sometimes with their own lives) the value of intralingual translation. Cyril I Lukaris (1572–1638) who, within a more general context of reforms and innovations which included the setting up of a Greek printing house and the translation into spoken Greek of the New Testament, is a case in point. And, continuing with this tradition, two centuries later Neophitos Vamvas (1776–1855), a Greek liberal intellectual and close collaborator of Adamantios Korais, was to play a crucial role in the translation (published in London in 1836) from Hebrew to modern Greek of the Old Testament. By then, however, the equation of Orthodoxy with Hellenism, with the question of a national identity, and with the consolidation of a modern national state, linked to the Church's anxiety to maintain the power and independence gained during the Tourkokratia, had converted Greek intralingual translation into a key doctrinal as well as national issue while marking profoundly, and for centuries to come, the Language Question. The conflict was to reach dramatic dimensions in the so-called *Evangelika*, the bloody street incidents in 1901 that forced the interruption of the newspaper publication of Alexandros Pallis's translation into demotic Greek of the Gospels, and again in 1903 (*Orestika*) following the performance of Aeschylus' tragedy as translated into a "mixed" Greek by G. Sotiriadis.

It was in the 18th century, however, the century of the Enlightenment and a period marked by intense intellectual curiosity, that translation into Greek began to acquire full-scale dimensions embracing an unprecedented variety of fields of knowledge: from works with a moral, pedagogical, and didactic purpose to works of narrative, theatre, philosophy, history, geography, law, mathematics, medicine, astronomy, psychology, political theory, and others. Evgenios Voulgaris (translator of Voltaire and pioneer of a Greek theory of translation), Josephos Moisiodax (pioneer of the spirit of Enlightenment in Greece and especially interested in translation), Dimitrios Katartzis (whose Prologue to Réal de Curban's *La Science du gouvernement*, 1784, constitutes the first attempt at a systematic theory of translation), Korais, and Rigas Pherraios are landmark figures in this tradition for whom translation theory and practice constituted an intrinsic part of the projects of national rebirth and emancipation to which they were committed. Questions of why, what, for whom, and how to translate began to be rigorously posed. Translation became a means for the introduction of new ideas and knowledge, a means of satisfying the need for a new code of moral and social values, of transferring to Greece the secularizing spirit of the Enlightenment. It was recognized as a crucial instrument of moral instruction and as a means for the cultivation of the spoken language as an instrument of written expression. Translation became a means whereby Greek people might become aware of, recover, and transplant to their own soil their rightful cultural inheritance, a means of elevating their educational and cultural level and of bringing the emerging nation into line with achievements in the west. Having access, through translation, to the ideas already available in other languages, developed by other nations, was a way of laying the foundations for Greece's own intellectual production, since no original intellectual production can take place without a constant cultivation and elaboration of the language in which

it is to be expressed. Translation for Korais, for example, was a crucial means of combating the Church's obscurantist hold on people's consciousness and education and, of course, people's education is directly linked to its emancipation as a nation. Thus, it is no accident that his calls for financial support of translation were made in patriotic terms; nor can it be doubted, as he argued in his *Mémoire sur l'état actuel de la civilisation dans la Grèce* (1803), that translations of works by Molière, Voltaire, Condillac, Montesquieu, Locke, and other scientific, philosophical, and historical works testify to the emerging nation's rapid progress and development. Every nation needs a model on which to base itself and, for all these men, the model of modern Greek cultural identity could not be other than that of Classical Greece as discovered and reconstructed in Europe. The decade 1790–99, marked by the ideals of the French Revolution, was exceptionally fruitful for translation into Greek and Rigas occupies an outstanding place in it. For him, translation was not only a means of struggle against ignorance but an efficient way of disseminating the most emancipatory and revolutionary ideas of his period: Voltaire and the Encyclopaedists D'Alembert and Diderot, Restif de la Bretonne, Montesquieu, Metastasio, Marmontel, Salomon Gessner, Abbé Barthélemy, selections of texts from astronomy, the natural sciences, and physiology.

The question of what to translate was obviously closely linked to the question of why translate. Translating not just any but those worthy works capable of transmitting knowledge as well as moral and ethical instruction became a conscious criterion of choice. To this was added the requirement for clarity and pleasurable reading, aiming as the Greek translators did at the widest possible circulation of the translated printed work. Equally important were the twin questions of whom should the translations be addressed to and how should the task of translation (methods, procedures, and form of target language) be carried out. If translation were to serve the pedagogical and national emancipatory aims of these men and provide the ideological elements out of which the modern Greek national identity was to emerge, it should address itself to the widest possible readership, to the emergent nation. And, naturally, its language could not be but the closest form to the Greek vernacular (even if purged of all foreign and vulgar elements, as in the case of Korais). Being conscious of translation's crucial role in introducing new concepts and terminology into the Greek language (and mentality) also made the 18th-century translators highly conscious of the additional difficulties facing the Greek translator: the lack of infrastructure (finance, dictionaries, and reference books), the lack of established linguistic norms, the poor state of spoken Greek as a result of the absence of sufficient experience and experimentation with it as a vehicle of written expression. And this consciousness produced another: the realization that translation was not only a source of knowledge and ideas but also, crucially, a space for the creation of language itself. Thus, as from the late 18th century, it is possible to speak of the beginnings of a Greek theory of translation that underlines the singularity of each text and the need of translation to respect and reflect it by adopting the appropriate form of language and style that demands precision and clarity, that introduces the concept of translation as faithful recreation, and, alongside the concept of usefulness, the aesthetic requirement of a "good" translation. Influential views on translation practice are encountered in Emmanouil Roidis's prologue to his translation of Chateaubriand's *Itinéraire* in 1860, in Iakovos Polylas whose translation activity embraced ancient Greek (Homer), Latin, and western classics (*Hamlet* and *The Tempest*), in Stamatios D. Valvis's outstanding essay *Peri Metaphraseos Poiiton* (On Translating a Poet, 1878) which poses many of the issues that still concern modern translation theory – the questions of translatability and ethnocentrism, among others – in Ioannis Kambouroglou's insightful prologue to his translation of Zola's *Nana* in 1880 (commenting on what is today known as dynamic or functional equivalence) and whose naturalist realism was to exercise a great influence on Greek literary writing, or in Ioannis Kakridis's *To Metaphrastiko Provlima* (The Translation Problem, 1936), an important source of information, moreover, regarding the history of Greek translation.

The role played by both intra- and interlingual translation in the construction of a modern Greek national literature cannot be overestimated. The methods, interventions, and statements, the works chosen, and, of course, the form of language used in translation provide a guide to the different – and changing – ways of conceiving the history and identity of Hellenism. For Andreas Kalvos and Dionysios Solomos the experience of translating from ancient Greek, koine, and modern European languages, especially Italian, not only helped them to find their own approach to the Greek language, to dig into Greek tradition and combine it with the European, but also provided them with elements that proved essential in their own poetry, thereby marking the subsequent course of modern Greek literature. George Seferis and Odysseus Elytis in the 20th century, both of whom translated the Revelation of St John, followed in their footsteps. Seferis's translations of T.S. Eliot (particularly *The Waste Land* in 1936) and Elytis's translations of, especially, French poetry played a key role in their poetics and, consequently, in the configuration of Greek postwar poetry. To this day, translation from katharevousa to demotic (Alexandros Papadiamantis is a case in point) remains a controversial issue, demonstrating that translation not only reflects but also generates ideas, conflicts, ideological and political stakes, and that the history of modern Hellenism is inextricably tied to the problem of translation. Today, Greece possesses a rapidly developing field of translation studies with interlingual translation, in which literature in English holds the lead, occupying one third of the total book publication. The fact that, in 1997, the European Prize for Translation was awarded to the Greek translation of James Joyce's *Ulysses* is undoubtedly an indication of the distance covered by Greek translation since its beginnings.

Travel

Long-distance travel was widespread in all periods of Greek antiquity. Already in the *Odyssey* we encounter itinerant experts, including seers, physicians, builders, and bards, who, as Homer tells us (17. 386), were "invited from the ends of the earth". Questions such as "Who are you? Where do you come from? What is your city? Who are your parents?", which occur frequently in the *Odyssey*, no doubt reflect the realities of Homer's own world where travel for military or commercial purposes was commonplace. In later times sophists and – a much larger category – mercenaries travelled extensively. In addition, many individuals occasionally made long journeys, either to attend a distant festival or celebration of the games, consult an oracle, or visit a healing sanctuary. It is unlikely that anyone ever undertook a long journey purely for pleasure, however. The most widely travelled Greek in antiquity was probably Herodotus, who in the 5th century BC visited Babylon, the Black Sea region, Egypt, and Phoenicia while researching his historical account of the Persian Wars, which is also the world's first travel book. The only guidebook that has survived is Pausanias' *Description of Greece*, written *c.* AD 150, which claims to describe "all things Greek".

Since no part of the Greek mainland is more than 100 km from the coast and since safe harbours abound, the most common method of long-distance travel as well as of transportation was by sea. Owing to the frequency of storms in the Aegean, however, seafaring was regarded as a dangerous undertaking. As today, it was largely confined to the months from May to October. In the winter very few voyages were undertaken, except in the case of an emergency such as that resulting from a desperate food shortage. A further hazard was piracy, which was endemic throughout the Aegean from early times onwards. Passenger ships were unknown and those who wanted to take a sea voyage would generally have had to stand on the waterfront and request a place on a cargo ship that happened to be travelling in the right direction, if not to their actual destination. No food or bedding was provided on board, so passengers had to come supplied with their own. The perilousness and unpredictability of the sea is a central motif in the *Odyssey*, since it is due to the wrath of the sea god Poseidon that Odysseus, who is returning home to Ithaca at the end of the Trojan War, loses all his companions and is delayed for nine years. Poseidon's enmity reflects a genuine paranoia about sea travel, notwithstanding its importance.

From early times the sea played a vital part in shaping Greek history and in moulding the Greek character. There is evidence of settlement in several of the hundreds of islands dotted around the Aegean already in the Early Bronze Age. Homer's world extended from Sicily in the west to the Hellespont in the east. It was surely due to their familiarity with this element that seafaring Greeks came to develop a flexible response to the challenges of the outside world. Almost all the most important city states possessed seaports and those that were landlocked remained conservative. The dichotomy is exemplified by the difference in character between the Athenians and the Spartans, the dominant powers in the Classical era. Whereas Sparta, an inland state, was reactionary and unenterprising, Athens, whose might and wealth were based on the sea, was innovative and progressive.

None of Greece's rivers is navigable and only a few have estuaries wide enough to serve as ports. Hence travel on the mainland was generally by road or track. Owing to the unevenness of the terrain, this tended to be slow, arduous, and difficult. Most people travelled on foot with a slave or two to carry their baggage because horses were not capable of travelling long distances or of negotiating the steep mountain paths that often provided the only means of access from one community to another. Likewise chariots and other wheeled vehicles were useful only over short distances. The island of Ithaca, which is described as "rugged and unfit for driving horses" (*Odyssey*, 13. 242), is typical of much of Greece and the suggestion that the road between Pylos and Sparta was sufficiently smooth to permit Telemachus to traverse it in a chariot is a sublime fantasy on Homer's part (*Odyssey*, 3. 482–86). Even so, horses remained important status symbols throughout antiquity.

It follows that in all periods up until the present day Greeks would have been accustomed to walking considerable distances. Socrates in Xenophon's *Memorabilia* (3. 13. 5) talks nonchalantly of undertaking a five to six days' walk from Athens to Olympia. Even though the distance from Athens' furthest demes to the capital is no more than 50 km, it is unlikely that its rural population would have regularly travelled to the city to attend meetings of the assembly, however. Probably women, the elderly, and the infirm hired wagons

drawn by horses, mules, or oxen to convey them short distances, where the roads permitted. In later times a litter or sedan chair, known as a *phorelon*, was available to the wealthy.

The dangers of moving about in a world where no protection was offered to travellers gave rise to the image of the culture hero, whose task was to clear the roads of brigands and wild beasts. Examples include Theseus and Heracles. One of the brigands eliminated by Theseus was Sciron who, after robbing travellers, ordered them to wash his feet before kicking them over a cliff into a ravine below. Though we hear of highwaymen only occasionally, they must have presented a constant danger on land, as did pirates on the high seas. To safeguard the interests of their compatriots, many states appointed officials called *proxenoi* in foreign cities. *Proxenoi* were resident aliens who lived permanently abroad.

In times of emergency a city might call upon the services of a professional runner to bear a message to an ally. The stamina of such runners was prodigious. A famous example was the Athenian Pheidippides, who according to legend ran from Athens to Sparta – a distance of 240 km – to request military assistance against the Persians in 490 BC. Pheidippides then ran a similar distance to Marathon and followed up this feat by running to Athens, whereupon, after delivering his report of the Athenian victory, he expired. In the Hellenistic era the Greek kings took over the highly efficient network of roads and communications maintained by the Persians throughout their vast empire.

A number of Greek roads that were used in historical times had their origins in the Mycenaean period. Very few were paved, but the Greeks developed a number of sophisticated roadbuilding techniques. These included ramps, switchbacks, and pulloffs, for which there is evidence already in the archaic era. All roads, however, were local, their purpose being to facilitate travel within a state's territory rather than to join communities to one another. Mule and drovers' tracks provided the only link between communities. It was common to bury the dead in family plots adjoining major roads, for which reason epitaphs frequently address the wayfarer.

Many sanctuaries were served by sacred ways, though these usually extended only a short distance. As Pausanias reports, however, even an international sanctuary like Delphi was difficult to approach on foot. The principal paved road in Athens was the Panathenaic Way, which began at the Dipylon Gate on the west side of the city and ended up on the Acropolis, barely 1.5 km away. A more functional paved road extended from the marble quarries on Mount Pentelikon to Athens. Goods were conveyed to and from the port of Piraeus along a paved cart road. During the Peloponnesian War, when it was no longer safe to travel outside the city, a road running the entire length of the Long Walls joining Athens to its port served in its place. The most impressive road-building project in Greece was the *diolkos* or slipway, which was constructed by the Corinthians in around 600 BC. The *diolkos* enabled ships to be towed across the isthmus of Corinth, rather than having to circumnavigate the Peloponnese. It remained in use until the 9th century AD.

Though Agamemnon supposedly conveyed his mighty army to Troy by sea, in historical times armies travelled to the theatre of war by land. Homer's warriors are usually conveyed to the battlefield in chariots, though they fight almost exclusively on foot. Their chariots remain parked while their owners engage, ready to provide a means of escape if their owners are forced to retreat or when they go off in search of a new opponent. Cavalry, though frequently mentioned in our sources, played a relatively minor part in Greek warfare.

In the absence of inns and hostelries, aristocrats in the Archaic period operated a system known as guest-friendship or *xenia*. This facilitated long-distance travel by providing hospitality on a reciprocal basis. The guest–host relationship was judged to be so sacred that its supervision was placed under the protection of Zeus Xenios. Homer suggests that guest-friendship transcended what passed for national boundaries. In the *Iliad* (6. 230f.) the Greek Diomedes and the Trojan Glaucus refuse to fight against one another once they have discovered their parentage "so that everyone will realize that our families have provided hospitality for one another in days of old". Not until the 5th century BC do we hear of facilities offering accommodation for travellers. These remained basic throughout antiquity. Even in a major commerical centre like the Piraeus, accommodation was limited. Aristophanes (*Frogs*, 112–15) indicates that its inns had a reputation for discomfort and bedbugs. By the middle of the 5th century BC the lack of decent facilities led Xenophon (*Revenues*, 3. 12) to recommend the construction of more facilities, though whether his advice was followed is not known. By the Roman period the situation seems to have deteriorated further. Cicero (*Letters to Friends*, 4. 12. 3) states that when a certain Servius Sulpicius journeyed to the Piraeus to collect the body of a friend, he found the latter stretched out under a tent, evidently because he had been unable to find more suitable accommodation in the port. Throughout antiquity the wealthy continued to find hospitality in one another's houses or brought tents and other gear in their entourage.

Under Roman rule the provinces of Macedonia in the north of Greece and Achaea in the south became linked by an efficient network of roads like the rest of the empire, with Thessalonica, Athens, and Corinth representing the principal hubs. The most important road in the region was the Via Egnatia, which ran in an east–west direction through Thessalonica, parallel to the northern border of the empire. It was strategically important in the late Republic at the time of the Civil Wars but declined in military significance from the 1st century AD onwards when the frontier moved north to the river Danube. In this period, too, Roman tourists began to visit Athens and other major sites. The first guidebook on Greece, which was essentially limited to the province of Achaea, was written by Pausanias (fl. AD 150).

The early Christians, notaby St Paul, travelled extensively through the Greek-speaking half of the empire, seeking to convert its population. When the Roman empire fell, the road system remained largely intact and travel continued. Guest houses known as *xenodochia*, which were run by monks, provided accommodation for pilgrims visiting holy places. Some Christians even adopted a wandering life-style and journeyed perpetually throughout the Mediterranean. With the advent of the Dark Ages, much forced migration took place throughout the region. Under the Ottoman Turks Greece became something of a backwater and long-distance travel became less frequent.

When the Ottoman empire began to fragment at the end of the 17th century, Greece became increasingly accessible to European travellers. Henceforth, the story can be told largely from the perspective of foreigners, many of them British, who were lured to Greece in part by the desire to acquire antiquities. Now, too, Athens became the focal point of any tour of Greece – a position which it retains to the present day, due not only to its incomparable treasures but also to its location as a convenient point of departure for travel within the mainland. In addition, the Piraeus, Athens' port, provides easy access to the Aegean islands, many of which, including Aegina, Hydra, Poros, and Salamis, can be visited in a day. The decision to establish Athens as the capital of the fledgeling kingdom of Greece following the Greek War of Independence in 1829 ensured that the city would be laid out on modern lines with broad thoroughfares. Shortly afterwards the Piraeus was provided with modern harbour facilities. It was also at this time that the first detailed maps of Greece were made.

Today large hotels dominate the islands and coastal towns of Greece and the needs of the tourist often prevail over those of the local residents. All the occupied islands of the Aegean are served by ferries, many of which originate from the Piraeus, Greece's busiest port. In addition, some islands are served by hydrofoils, known popularly as "Flying Dolphins". Recently catamarans have also been introduced to some routes. The Aegean is host to numerous cruise liners in the high season. Athens Airport has two main terminals, East and West, which handle a vast amount of international and domestic air traffic in the summer months. Greece's national airline is Olympic Airways; its affiliate, Olympic Aviation, provides domestic flights. The road system still remains somewhat rudimentary by the standards of other European countries. The only major highways are those that run between Athens, Thessalonica, Volos, and Patras. The train service is very limited, the most efficient line being the one that runs between Athens and Thessalonica. There is also a narrow-gauge railway that connects Athens to stations in the Peloponnese. By contrast, Greece's bus service is excellent and virtually every village, no matter how remote, is provided with a service. Travel in Athens tends to be slow, owing to the heavy congestion. In an attempt to ease the congestion and pollution, cars with an odd-number licence plate are permitted to enter the central area only on dates with an odd number and those with even-number licence plates on even dates. Athens' metro, however, which began in the 1930s with one line running from Kifisia to the port of Piraeus, now has two further lines, opened in January 2000.

Trebizond

City on the southeast coast of the Black Sea

Trebizond is the English name for the Greek Trapezous, modern Turkish Trabzon, a city in the Pontus, on the south-eastern shore of the Black Sea. The port was a Greek colony, daughter of Sinope and granddaughter of Miletus, from the 7th century BC (its traditional foundation date of 753 BC is much too early). Historically Trebizond owes its importance to two factors. First, as Xenophon found as early as 400 BC, it is the political capital of a distinct and persistent local identity, a combination of indigenous, especially Caucasian (including Laz), people and of Greek colonists and culture (Pontic Greek is one of the oldest spoken examples of the language). Second, Trebizond is the furthest port east through which European shipping could once reach an overland route that penetrates Central Asia. This combination of factors made Trebizond both a local provincial capital and, intermittently, a port of intercontinental strategic and commercial importance. The periods of the city's commercial importance (especially from 1258 to 1475 and from 1829 to 1869) coincided with its local autonomy (particularly under the Grand Komnenoi, emperors of Trebizond from 1204 to 1461) and with the patronage of most of its major monuments.

The city basically consists of two settlements, hemmed between the sea and Mount Minthrion (Boz Tepe). On the west is a naturally defensive site, wedged between two deep ravines that narrow to an acropolis 1 km inland, on which the Upper City bears the accumulated masonry of an administrative citadel and palace of the Grand Komnenoi. Below it the Middle City is dominated by the domed basilican cathedral of the Chrysokephalos, remodelled as a coronation church in the 13th century, now the Orta Hisar Camii and principal mosque of Trabzon. Trebizond was an episcopal see from the 3rd century AD and Justinian dedicated its aqueduct to St Eugenios, its patron martyr. The Lower City reaches the sea to embrace an artificial harbour, the Molos, plausibly attributed to the emperor Hadrian (AD 117–38).

The second settlement lies about 1 km east of the walled city and acropolis, around the commercial harbour of Daphnous. Trebizond appears to have lacked many of the conveniences of a Hellenistic city, such as a theatre, although the cathedral probably stands on the site of a temple. But the modern street plan that links the city with the eastern suburb reveals a Milesian or Hippodamian grid, such as in Sinope, Histria, and Cherson, of blocks of about 100 ¥ 60 m, complete with a *cardo*, or main street. Four empty blocks suggest an agora, today the *meydan* or main square of Trabzon, around which all the Classical inscriptions have been found. This open space overlooking Daphnous is the oldest monument of Trebizond in continuous use; it became the supply base of the Roman campaign against Armenia in AD 58, from AD 64 of the legion XV Apollinaris, stationed at Satala (Sadak), of Justinian's 6th-century Laz and Persian wars, and of 9th- and 10th-century

Trebizond: 17th century engraving of the city which was the last Byzantine outpost to fall to the Turks, in 1461

Byzantine campaigns on the eastern frontier, when Trebizond was capital of the theme of Chaldia. From the 13th century it became the ceremonial square of the Grand Komnenoi and assembly point of caravans going south. Venice and Genoa built their own castles on the seaward side – the latter, Leontokastron (now Güzel Hisar), rivals that of their host emperors. The *cardo* (now Meraş Caddesi) remains the principal commercial quarter and bazaar of the city. The overland route to Tabriz, 32 staging posts away, reaching eventually to Central Asia, was already in decline after the break-up of the Mongol and Timurid empires before sultan Mehmet II conquered Trebizond in 1461. The *meydan* was reanimated after 1829, when western traders returned to exploit the overland route to Persia, but declined after 1869 when the Suez Canal offered a more convenient alternative. Trebizond is not a convenient port. Although Daphnous faces east, before the 20th century all goods had to be beached or taken ashore by double-ended lighters, including the first Ford motor car, rowed ashore in 1921. Until then pack animals assembled in the *meydan*; today the stables on its corner have been replaced by the garage of the Ulusoy Bus Company. Marco Polo was not the last to mislay his luggage on the square.

The Greek monuments of Trebizond reflect its periods of prosperity before the exchange of populations of 1923, since when its demography has been transformed. Of the first period of prosperity under the Grand Komnenoi, from 1204 to 1461, the Chrysokephalos in the Middle City and St Eugenios (Yeni Cuma Camii) in the eastern suburb are preserved as mosques, their paintings and *opus sectile* floors safely hidden. The paintings and mosaic floor of the 13th-century monastic church of St Sophia in the western suburb are preserved as a museum. Of the final period of Trapezuntine Greek prosperity the exotic house that Constantine Kapayiannides built in the summer resort of Kryonero (Soğuksu) above Trebizond in 1903 is happily preserved as a museum too, because Mustafa Kemal Atatürk wrote part of his will there in 1937. But, after the *meydan*, the most impressive surviving monument of Greek culture in the city is the Phrontisterion, which still stands between the square and the sea, beside the site of the colossal and now dynamited cathedral of St Gregory of Nyssa. Founded by Sebastos Kymenites in 1683, this institute of higher education could claim to be the first of its kind in the Black Sea – Kymenites went on to regulate others in modern Romania. The elegant 19th-century building of the Phrontisterion now houses the Anadolu Lisesi, which retains its function of enlightenment.

Summary

A city on the southeastern shore of the Black Sea, Trebizond was founded as a Greek colony in the 7th century BC. Its position on the land route to Central Asia made it an internationally important port. Commercially it flourished especially under the Grand Komnenoi from 1204 to 1461, and in the 19th century. Several Greek buildings

survive, having been converted for use as mosques, museums, or schools.

Trikkala

City in Thessaly

Trikkala has had a long and varied history. As Trikka or Trike it appears in the *Iliad* as the home of the sons of Asclepius, one of whom, Machaon, was the chief physician of the Greeks. There are signs of Mycenaean and early Iron Age settlements in the area. In Classical times the town did not figure very prominently, situated as it was in a remote part of Thessaly, itself on the periphery of the Hellenic world. It appears occasionally in inscriptions. There is a shrine to Asclepius in the area. In 352 BC it suffered during the war between the Phocians and Philip of Macedon. It played a part in the wars between Rome and Macedon and that between Caesar and Pompey, occupying a strategic position at the foot of the high Zygos pass that provides the only route between Epirus and Thessaly. It was one of the cities that according to Procopius was fortified by Justinian (527–65), and there are traces of masonry from this period in the Turkish fortress, which is a conspicuous feature of the modern town. There is also one church that is of 6th-century origin.

After Justinian Trikkala passed from Byzantine control. In the 11th century, after Basil II (976–1025) had regained the Balkans, we still find Kekaumenos referring to Trikkala as a Vlach town. He is the first person to give the town its modern name, which may have a Vlach origin; as in Homer, there has always been some doubt as to whether it had two *k*s or one. Briefly captured by the Normans in 1082, Trikkala after the Fourth Crusade was sometimes in Byzantine, sometimes in Epirot control. The Serbs occupied it in 1348, and the last Serbian ruler in the region, Symeon Uroš, made it for a short time the capital of the fragment of the empire that he had inherited from his brother Stephan IV Dushan. The 13th and 14th centuries in spite of, or more probably because of, the frequent changes of ruler were great periods for church building, and most of Trikkala's Byzantine churches date from this period.

The Turks made Trikkala a provincial capital, the seat of a bey, and many Turks moved into the town. Remains of a picturesque Turkish quarter including a graceful mosque can be seen to this day, although all the Turks left after World War I and the exchange of populations. A third element of the population were the Vlachs from the villages of the Pindus who came down to the town in winter. Writing at the beginning of the 19th century, Leake comments on the mixed population, noting that many of the Turks were absentee landlords. At the time he wrote, Trikkala was controlled by Ali Pasha from Epirus, and the town had been sacked by marauding Albanians in 1770. Holland, writing of a journey in 1810, said that the population was mainly Turkish, and enumerates ten churches, seven mosques, and two synagogues. In 1853 Tozer talks of gleaming minarets, but these have vanished.

In 1881 Trikkala became Greek. Possibly because of the Turkish element in the population it did not play a particularly prominent part in the war of 1897 or the campaign to free Macedonia or the Balkan Wars, as might have been expected from a town that was on the borders of the unliberated areas of Macedonia and Epirus. The Balkan Wars moved back the frontier, and the exchange of populations removed the Turkish element. There was some brigandage between the wars, and the town suffered in World War II and the Civil War that followed it. The severed head of Ares Velouchiotis was displayed there in 1947. These not very distant events seem a far cry from the present state of Trikkala, pleasantly situated on the banks of the Lethaios river with the plains of Thessaly on the one side and the Pindus mountains on the other. Although only the third town of Thessaly after Larissa and Volos, to which it is attached by an erratic rail service, Trikkala acts as the centre for both the villages of the west Thessalian plain, and for the villages, many of them Vlach, of the east Pindus, the local bus station being a hive of activity.

Summary

The third city of Thessaly after Larissa and Volos, Trikkala has existed since the Bronze Age and is mentioned by Homer. It had a shrine to Asclepius. As the gateway to the Zygos pass it was fortified by Justinian. Occupied by the Serbs in 1348, it was briefly the capital of their empire. Under the Ottomans it was a provincial capital. It became Greek in 1881.

Triklinios, Dimitrios *c.*1280–*c.*1340

Scholar

Triklinios was born in Thessalonica probably around 1280. He began his scholarly career in his home town under the guidance of Thomas Magistros. One of his early editions is a rhetorical corpus (Hermogenes and Aphthonius) contained in an autograph of 1308, in which Triklinios still calls himself Triklines. In his edition of Hesiod (another autograph, dated both 1316 and 1319) Triklinios for the first time subscribes as Triklinios; before this he may already have undertaken an edition of Theocritus. He also corrected the text of what is our chief manuscript witness for the fables of Babrius. Compared with his later work, however, these are mere preliminaries.

During the second decade of the 14th century Triklinios came into contact with the school at Constantinople of Manuel Moschopoulos, who had become the successor of Maximos Planudes; Triklinios either stayed longer in the capital himself or at least visited it several times during those years. At Constantinople he worked with manuscripts written by Planudes and revised the Planudean Anthology. Moreover, the contacts with Moschopoulos and his school apparently stimulated Triklinios's interest in ancient metre and set him on his way to his most decisive contribution to scholarship: Triklinios in fact came furthest of all Byzantine scholars in grasping some basic principles of ancient Greek lyric metre. In this area scholars before Triklinios could draw upon not much more than the metrical handbook of Hephaestion and more or less ancient notes (scholia) connected with the poems of Pindar. Moschopoulos had already made a start in further elucidating the structures of Pindaric metre (he was the first to discover the triadic structure in Pindar's *Olympian Ode* 5), but Triklinios in time surpassed Moschopoulos considerably. He developed a firm understanding of the triadic strophic systems in Pindar's choral songs (in which the first two parts of a triad are characterized by elaborate responsion) and after that probably turned his attention to the lyric passages of the Attic dramatists, which (apart from some metrical scholia on Aristophanes) were almost totally devoid of any help with the metre. Working on the tragedians Triklinios gradually discovered that the lyrics in Greek drama had structures similar to Pindaric odes (i.e. triadic and internally responding), a really fundamental insight; by 1319 he seems to have come to a full appreciation of responsion in tragic lyrics.

Working with Moschopoulos apparently induced Triklinios to produce his first commentary on Pindar, which contained only the *Olympian Odes*. After returning to Thessalonica – where he was to stay until his death (around 1340) – he embarked on annotating and editing the Greek dramatists (his work on Euripides probably started only after he had already worked on Aristophanes and Sophocles, with Aeschylus probably coming last, i.e. not before 1330); he also expanded his commentary on Pindar beyond the *Olympian Odes*. Careful study of manuscripts connected with Triklinios (e.g. Triklinios's autograph of the "Byzantine triad" of the plays of Aristophanes, i.e. *Plutus*, *Clouds*, and *Frogs*, discovered by Koster in the 1950s) has shown how he proceeded: he copied a manuscript of Thomas Magistros, revised its text several times, added metrical notes and excerpts from the old scholia to Thomas's commentary, and thus created a new edition. Triklinios proceeded similarly in the case of the Euripidean triad: he based his own edition on Thomas's so-called second edition of Euripides and supplemented it over the years with additional notes; he also rewrote a number of pages, especially those containing choral parts, which he corrected considerably. Triklinios's "work in progress" on this and other authors well shows how he moved from a more primitive metrical annotation to a more complex one.

It is important to note that Triklinios also moved beyond the very restricted number of plays tackled by his predecessors as part of the normal Byzantine school curriculum – the "triad" of Aeschylus (*Prometheus*, *Persians*, *Seven against Thebes*), of Sophocles (*Ajax*, *Electra*, *Oedipus Tyrannus*), of Aristophanes (see above), and seven plays by Euripides. Thus, among the five tragedies of Aeschylus edited by Triklinios there were two (*Agamemnon* and *Eumenides*) that had previously been ignored. Of Sophocles, Triklinios edited all seven plays still extant, basing this edition on a text by Thomas Magistros (who had supplied only four tragedies with notes), on Moschopoulos's recension of the Byzantine triad, and on one or two "old" (i.e. pre-Palaiologan) manuscripts. Triklinios's edition of Aristophanes contained eight plays instead of the former three. Most important, however, was his edition of all the surviving plays of Euripides: he found the sole surviving manuscript of the so-called alphabetic plays of Euripides and revised and annotated it.

By this indefatigable activity over many years, Triklinios became the greatest of all Byzantine editors of Classical Greek texts. He wrote introductions and explanatory notes for the metre of each part of the plays he commented upon, and he usually tried to base his editions on several manuscripts, a practice not yet very common in his time (or afterwards). It was in these editions of dramatic texts that Triklinios reaped a rich harvest of corrections based on his superior knowledge of metre; Triklinios in fact is the only Byzantine scholar whose name still appears in the critical apparatus of modern editions of ancient texts. Apart from his editorial work, Triklinios had other scholarly interests as well, for example in astronomy (he wrote an essay on lunar theory) and in geography (he annotated a manuscript of Ptolemy's *Geography*).

In the later decades of his life, contacts between Thessalonica and Constantinople became much more precarious (due to the constantly deteriorating political situation of the dwindling empire and Thessalonica's growing isolation), so that Triklinios's final editions with their remarkable philological achievements apparently remained unknown in Constantinople until the beginning of the 15th century. Between 1423 and perhaps 1432 an increased interest in Triklinios's philological contributions is documented by some manuscripts written then (in the circle of John Chortasmenos); another such period already postdates the fall of the empire (1489–95: manuscripts produced in Crete, where the material remains of Triklinios's scholarship had been transmitted). Every time, however, that Triklinios's work was brought to the attention of scholars, they have been justifiably enthusiastic about his mastery of the principles of ancient Greek metre, the level of which had not been attained since Alexandrian times and was reached again only several centuries afterwards in western philology. Already one of Triklinios's pupils in his awe

called him a "mystagogue", Wilamowitz (1889) acclaimed him as the first modern critic of tragedy, and still today his achievement is judged as "admirable on any count" (Zuntz, 1965).

Biography

Born in Thessalonica *c.*1280, Triklinios was a pupil of Thomas Magistros. Visiting Constantinople he had contact with the school of Manuel Moschopoulos and worked on manuscripts copied by Maximos Planudes. He developed an unprecedented understanding of ancient lyric metre and wrote a commentary on Pindar. He also edited the texts of the three great tragedians of Classical Athens, and of Aristophanes. He died *c.*1340.

Trikoupis, Charilaos 1832–1896

Politician

Charilaos Trikoupis was the most important Greek reformer of the 19th century. His contribution was multifaceted. He was responsible for ensuring that the royal head of state would refrain from granting a mandate to governments that lacked the confidence of parliament, he introduced legislation that secured the tenure of civil servants, he created a modern political party based on liberal democratic principles as well as discipline, he improved the readiness of the armed forces and military education, and, most of all, he attempted the monumental task of creating the infrastructure necessary for the take-off of the Greek economy. His thrust, however, was impeded by unfavourable international circumstances and his foreign loans therefore were instrumental in inflicting bankruptcy on the state. Although he did not live to witness the fruition of his strategy for growth, subsequent generations of politicians reaped the harvest of his labour.

Son of Spyridon Trikoupis (historian and prime minister), he studied law in Athens and Paris and entered the diplomatic service in 1856. While serving in London he was elected representative of the city's Greek community in the Hellenic parliament. As a parliamentarian, Trikoupis made good use of his diplomatic skill during the negotiations for the 1864 accession of the Ionian islands to Greece. In 1865 he resigned from the diplomatic service and was elected representative of Missolonghi, his parental home-town. In 1866 he became foreign minister in a government headed by his future political opponent, Alexander Koumoundouros, and signed a treaty with Serbia. During the 1874 constitutional crisis his famous article, "Who is to blame?", criticizing royal interventions in parliamentary politics, earned him a brief prison sentence, but his position was vindicated. He was foreign minister again in the 1877 grand coalition under Constantine Kanaris and in 1880, after the fall of a Koumoundouros government, he became prime minister. His 1882 government was the first of several, the duration of which allowed his reforms to take effect. His defeat in 1885 by his populist opponent Theodoros Deliyannis reflected public discontent with his austerity programme. The see-saw of victory and defeat between Trikoupis and Deliyannis continued during the decade of 1886–96, but with the bankruptcy of 1893 the former's popularity waned until his abject electoral defeat in 1895. He died in a Parisian hotel a year later while Greece was hosting the first modern Olympic Games.

Trikoupis's times constitute an interlude between two eras of modern history. The transition from steam to electricity was accompanied by a protracted recession of the more developed Western economies with a concomitant dearth of domestic demand for capital. In their quest for customers many Western banks turned to the states of the developing periphery of Europe and Trikoupis was quick to embrace the opportunity of available credit to spur the growth of his country's economy. His substantial investment in the construction of railway networks was aimed at unifying disparate agricultural regions into an expanded market. In this project Trikoupis was repeating the experiment of western European industrial prototypes. His venture however yielded fewer economic results in the short term than was anticipated. Domestic markets were still in their infancy and could not be induced technologically to a state of development that required a few decades of growth and social transformation. Although this and other public works laid the infrastructure of a transportation system that proved invaluable for the future take-off of the Greek economy, the railways of Trikoupis were in his time perceived as a premature and costly undertaking that benefited speculators, financiers, and international middlemen. Such people became a familiar spectacle in the Greek capital and the object of criticism by Trikoupis's chief political opponent, Deliyannis. The latter was an exponent of splendid isolation from international financial influences and a firm believer in an agrarian economy that aspired to self-sufficiency, rather than economic growth. Deliyannis's major flaw, however, was his predilection for irredentist adventures that proved inconsistent with his pipe dream of independence from foreign creditors and great-power involvement. His views in fact caused more foreign

intervention in Greek affairs than Trikoupis's own policy of growth.

At about the same time, Russia's return to Balkan politics after a long period of absence, following its Crimean misadventure, revived the slumbering Eastern Question. The Russo-Turkish war that ended in 1878 with the San Stefano treaty encouraged the irredentist debate in the Balkans, and Greek governments were faced with the dilemma between Trikoupis's priority of domestic development and Deliyannis's agenda of territorial aggrandizement. Trikoupis had visited Serbia, Bulgaria, and Romania in an abortive attempt to forge a Balkan alliance in 1891 but was soon disappointed and thereafter pursued a policy of abstaining from confrontations with Turkey. In the Cretan uprising of 1889 he went as far as to discourage the insurgents and was for that reason defeated in the elections.

The Graeco-Turkish war of 1897 was largely created by the political camp that considered irredentist priorities more pressing than development and growth. The disastrous outcome of the war nevertheless vindicated Trikoupis.

THANOS M. VEREMIS

Biography

Born in Nauplia in 1832 the son of prime minister Spyridon Trikoupis, Charilaos Trikoupis studied law in Athens and Paris. He entered the diplomatic service in 1856. In 1865 he became MP for Missolonghi and in 1866 foreign minister. He was five times prime minister: 1880, 1882–85, 1886–90, 1892, 1893–95. He modernized the economy and the armed forces. He died in Paris in 1896.

Tripolis

City in Arcadia

Tripolis, the capital city of Arcadia, lies at the foot of Mount Mainalon, in the centre of the Arcadian plain at an altitude of 655 m above sea level, surrounded by Mainalon, Ktenias, Artemision, Parthenion, Taygetus, and the mountains of Dimitsana. Due to its geographical position, it is the administrative centre of the Peloponnese and has between 30,000 and 35,000 inhabitants. The city's economy depends on several industrial units related to leather dressing, carpet making, weaving, cheese manufacture, etc. Its inhabitants are also engaged in trade, cattle breeding, and agriculture. In the vicinity there are marble quarries as well as local iron ores. In the 20th century Tripolis suffered the greatest mass emigration of all Greek regions.

In 1476 Stefano Magno in his *Estratti degli Annali Veneti* referred to "Dropoliza" as one of the deserted castles of the Peloponnese and we find the same toponym on maps dating from the 16th century. As far as the provenance of the name is concerned, it is generally accepted that the name Dropoliza, which changed in the 19th century to the literary form Tripolis, derived from the Slavonic word *dabr*, which means oak tree. This agrees with Pausanias' description (*c.*AD 150) which confirmed that the place was full of oak trees. The originally obscure settlement began to develop after the conquest of Mouchli(on) by the Ottoman Turks in 1458, but the name Dropoliza is rarely mentioned during the first two centuries of Ottoman rule. In the middle of the 17th century sources refer to revolutionary activity by several people originating from Tripolis, and references become more frequent after the end of the Turko-Venetian war (1686–99), when the Peloponnese was occupied by the Venetians. The *teritorrio* of Tripolitza had a population of no more than 8000, including 1200 inhabitants of the town of Tripolis and also about 50 large villages.

The reoccupation of the Peloponnese by the Turks in 1715 was an important event for the history of the town. At first it was one of the 17 *vileatia* (provinces) into which the region was divided and after 1719 it became the seat of the pasha of the Peloponnese. Its population increased gradually and by the end of the 18th century it had reached 10,000 inhabitants, of whom one quarter were Turks. During the Orloff rebellion (1770) the town was besieged by the Russians and the Peloponnesians and was badly damaged. Until 1799 Tripolis suffered continuous disasters and plunderings by Albanian troops. From 1807 to 1812 Veli Pasha, the second son of Ali Pasha, was commander of the town. In the last decade before the revolution it was the most important military base in southern Greece. The siege of Tripolis by the Greeks started in the first days of April 1821 and lasted five months, resulting in its capture by Theodore Kolokotronis and his men on 23 September 1821; this victory was the first important prize of the Greek revolution. After the liberation, Patras, Nauplia, Kalamata, and Tripolis became the most significant administrative centres of the Peloponnese, which was then divided into five prefectures. Tripolis – the name was established at that period – was the capital of the prefecture of Messenia. In February 1822 it became the seat of the Peloponnesian Senate. In June 1825 Ibrahim conquered Tripolis, and destroyed it completely on 16 February 1828. In 1834 the Court of First Instance was installed there, as well as one of the two courts of appeal in Greece. During the 19th century Tripolis showed important progress in the cultural and economic fields.

The town of Tripolis, although totally destroyed in 1828 by Ibrahim, still preserves important architectural monuments. The cathedral of Hagios Vasileios and the church of Hagioi Taxiarches, the Neoclassical Malliaropouleion Municipal Theatre, Mantzouneios Municipal Library, town hall, and court of justice are some of the most important traditional buildings in the town. The Archaeological Museum (1895–1905), which was designed by the famous Austrian

architect Ernst Ziller, houses the cultural and archaeological treasures of Arcadia. Many important personalities were born in Tripolis, including the poet Konstantinos Karyotakes, the writer Nikos Gatsos, the academic Nikos Veis, the philologists G. Mystriotes and D. Goudes, and the writers T. Valtinos, Y. Panou, B. Benopoulos, G. Lambrakis, A. Petronotes, and the Angelopoulos brothers.

Summary

The capital of Arcadia, Tripolis is the administrative centre of the Peloponnese. The town was of little importance before the 17th century. In 1719 it became the seat of the pasha of the Peloponnese. It was liberated in 1821 and became the seat of the Peloponnesian Senate. It was destroyed by Ibrahim in 1828 but recovered later in the 19th century.

Trojan War

The Trojan war was a legendary expedition undertaken by the Mycenaean Greeks against the people of Troy, the modern Hisarlik which lies in northwest Asia Minor, 6.5 km from the Aegean coast. This military operation was made famous mainly through the *Iliad* and *Odyssey*, two epic poems attributed to the Archaic poet Homer.

Hisarlik's identification with the Homeric Troy has never been proved, but it is generally assumed that the legends relating the Trojan War also encompass elements of historical truth. It is plausible that the Mycenaean Greeks could have destroyed Troy between 1270 and 1190 BC; Troy VIIa – which lasted until 1190 BC – is considered by Carl Blegen to be the Homeric city, but others push the date of the sack back to *c.*1270 BC, the time that coincides with the peak of power of both Mycenaean Greece and Troy. According to Thucydides, the Achaeans' sack of Troy led to no permanent settlement in the Troad; instead the Greeks returned home with their plunder to face destructions connected with the Dorian invasion, which put an end to the Mycenaean period.

Neither the *Iliad* nor the *Odyssey* gives a comprehensive account of the events related to the Trojan War. The *Iliad* concentrates on only four days of fighting in the tenth and last year of the war and its major theme is Achilles' anger over Briseis, who was given to him as booty and subsequently taken away from him by Agamemnon. The *Odyssey* includes consecutive flashbacks of Odysseus' adventurous trip home, and its second half is devoted to Odysseus' cunning restoration of order in Ithaca.

Several other aspects of these events were covered by the cyclic epics, subsequent hexameter poems reproducing the repertoire of the oral bards and indicative of the heroic poetry before Homer. Among them, the *Cypria* narrates the causes of the Trojan War, the judgement of Paris, the abduction of Helen, and the gathering of the Greeks in Aulis; the *Aethiopis* recounts the story of Amazon Penthesileia and the death of Achilles; the *Sack of Ilium* deals with events connected with the Greek victory such as the ruse of the wooden horse and the deaths of Priam and Astyanax; the *Telegonia* narrates the later adventures and the death of Odysseus.

The Trojan War is widely represented on Greek vases, sculpture, and architecture. Among the earliest Archaic representations of scenes from the Trojan War are the wooden horse on the 7th-century pithos of Mykonos (still in situ), the pediments of the temple of Aphaia Athena in Aegina, and several black-figure vases from Athens and elsewhere. Famous later representations include the metopes from the north side of the Parthenon and the temple of Asclepius in Epidaurus.

Subsequent Greek literature gives centre stage to the Trojan War. Both Herodotus and Thucydides attempt to provide rational accounts of the war, but Stesichorus' famous *Palinode* and Sappho's ode to Helen's passion for Paris (fr. 16 L-P) are indicative samples of the poets' early fascination with the legendary beauty of the queen of Sparta. Helen, the dehumanizing power of the war, and the ambiguities of military heroism are also some of the main themes developed further in the Athenian tragedies of the 5th century BC. Famous among those surviving are Aeschylus' *Agamemnon*, Sophocles' *Philoctetes*, and Euripides' *Hecuba*, *Andromache*, *Troades*, and *Iphigeneia in Aulis*. In post-Classical times *Hecuba* was one of the three tragic plays of the Byzantine academic canon. In early modern times the earliest attempts at the revival of tragedy include P. Katsaitis' *Tragedy of Iphigeneia* (1720) and Metastasios' *Achilles en Skyro* from the period of the Greek Enlightenment (1794).

The Trojan War and its deeply human conflicts have survived in Greek literature to the present day. Modern literature, mainly of the late 19th and the 20th century, has given remarkable centrality to the Trojan myth. Constantine Cavafy's famous *Ithaca* (1905–1915) is the first in a series of symbolic interpretations of Odysseus' wanderings as an inexhaustible source of self-learning and self-renewal; Nikos Kazantzakis' *Odysseia* (1938), with Odysseus involved in a revolt against Pharaoh in Egypt and in an uprising of workers and slaves in Knossos, is another striking example.

Ancient Troy is rooted in the poets' subconscious life. It is part of a continuum: in Angelos Sikelianos's *Lyrikos Vios* the epic coexists with folk elements and Odysseus is linked with Solomos and Palamas. In poems such as George Seferis's *King of Asine* (1940) and *Helen* a series of images evocative of the nation's past becomes the means that captures the mood of current historical moments. The Homeric themes give depth to modern Greek worries and visions and the Homeric figures are anachronistically revived in modern Greek society. So Takis

Trojan War: Sophia Schliemann wearing the so-called Treasure of Priam, discovered by her husband at Troy

Sinopoulos portrays Helen and Elpenor in a taxi or on the train from Larissa; similarly, Yiannis Ritsos' Agamemnon, Heleni, and Iphigeneia, even though explicitly evoking their mythical past, are familiar figures of modern Greek reality, whose disturbingly disrupted lives reflect the political and social turbulence of this reality that Ritsos wants to denounce.

Alongside the existential projection of the Trojan myth into modern Greek poetry, the Trojan War has had a separate revival with a wider social impact in many modern performances of Greek tragedy. Even though several Trojan plays – such as Euripides' *Helen* – were not properly re-established until the 1960s, the Trojan saga was the subject of engagingly powerful performances; notable among them were Marika Kotopouli's acclaimed Hecuba in the Panathenaic Stadium (1927), when the chorus of the defeated Trojan women-refugees recalled recent poignant memories of the Asia Minor defeat, and Anna Synodinou's moving Andromache in the theatre of Dodona (1963).

Tsakonians

Ethnic group from the eastern Peloponnese

There are still today on Mount Parnon in the eastern Peloponnese a few villages where Tsakonian is spoken. This is a language of Greek origin, but it is virtually unintelligible to other Greeks. Alone among modern Greek dialects Tsakonian appears to derive not from the Attic koine, but from Doric, the dialect of ancient Sparta, which is parodied by Aristophanes, appears on inscriptions, and is recorded in the 5th century AD by Hesychius. The most obvious feature of the dialect is the substitution of alpha for eta. Thus "day" in Tsakonian is *hamera* (instead of *hemera*), "mother" is *mate* (instead of *metera*). Another feature of ancient Spartan apparent in Tsakonian is the rhotacism that turns *tes hemeras* into *tar ameri*. The dialect has other peculiarities that owe nothing to Spartan origins, in particular the fact that the present and imperfect tenses can only be found in a periphrastic form. Thus "I see" is *emi horu* or *emi horua* if the speaker is feminine, and "I was seeing" is *ema horu*.

The similarity between the words *Tsakones* and *Lakones* has led both ancient and modern writers to claim a further proof of this remarkable survival, but the similarity may be coincidental. The Spartans called themselves Lakedaimonians rather than Lakonians and the change from *l* to *ts* is not explicable, although other consonants do change to *ts*, *kai* becoming *tse*. The first reference to Tsakonians is in the *Chronicle of Monemvasia* (*c.*1000 AD). This describes them as living in the neighbourhood of that town, simultaneously claiming that the Lakonians, still preserving their dialect, had fled to Italy; one version of this chronicle expressly links Lakonians and Tsakonians. Other medieval sources are less specific about the Lakonian origins of the Tsakonians, and indeed do not necessarily describe them as an ethnic group or place them in the

Peloponnese. Thus Constantine VII Porphyrogennetos (913–59) among others mentions Tsekones as a kind of military corps, and we find Tsekones and Tsakones referred to in Thessaly and Macedonia. Sometimes the term is used with a derogatory religious sense to describe Paulician heretics.

In the 14th century the *Chronicle of the Morea* places Tsakonia in the Peloponnese without any very precise location, and in the 15th century Theodore Palaiologos mentions Tsakonia and the names of some existing Tsakonian villages such as Prastos and Kastanista. In 1668 the Turkish traveller Evliya Çelebi appears to place Tsakonia to the west rather than the north of Monemvasia. This may be a mistake, but it might suggest that the dialect was once spoken more widely. When philologists discovered Tsakonians at the end of the 18th century, they were confined to Cynouria, a small area of north-eastern Laconia, and perhaps numbered about 10,000 people. In the past few years, with new roads in the interior and Leonidion on the coast more accessible by sea, Tsakonians have been subject to the modern pressures that destroy minority languages.

Sparta was a conservative state and tried to preserve its particular constitution even in the Hellenistic age. There is evidence, however, that in the towns koine rapidly prevailed, and 2nd-century AD inscriptions in Sparta do not differ from those in Athens. It was different in remote rural areas. Two other factors combined to keep a Dorian dialect going. Laconia was reluctant to accept Christianity with its centralizing tendency, and we hear of paganism in Mani as late as the 8th century. Moreover the Slav invasions of the 6th and 7th centuries would cut off Dorian pockets from their fellow Greek speakers. The slow reclamation of mainland Greece from the Slavs would require special bodies of soldiers, and it is therefore not surprising that we find Tsakones both in the Peloponnese and elsewhere, although only in the former did the name last and only in the former did they speak a dialect derived from ancient Spartan. Attempts to link the language of the Tsakonians in Cynouria with other odd dialects such as the language of Silli in Asia Minor (Pernot, 1934) and even the language of the Vlachs in the Pindus (Katsanes, 1989) seem far fetched, although there were Tsakonian colonies in the Propontis that after the transfer of the populations managed to preserve their dialect for a time in the Macedonian village of Chionades. The number of those stubbornly speaking Tsakonian now is about 300, and the fate of the language seems as doomed as that of the 300 who fought at Thermopylae.

Summary

Tsakonians are a people who live in the eastern Peloponnese and speak a language that appears to derive from Doric. Attempts to link this Tsakonian language with Lakonian are unproved. Today Tsakonian speakers number about 300.

Tsarouchis, Ioannis 1910–1989

Painter, stage designer, and director

The painter Ioannis Tsarouchis was born into an affluent merchant family. Tsarouchis's talent extended to many fields, but it is no exaggeration to style him the father of postwar Greek painting. His first period proper as a professional painter began in 1936 following his studies under Konstantinos Parthenis at the School of Fine Arts in Athens from 1928 to 1934. He had also been an apprentice, from 1930 to 1934, in the workshop of the painter Photis Kontoglou who introduced him to the secrets of Byzantine painting and to the whole culture of Byzantium in general. Tsarouchis's second period, highly influenced by the European Renaissance, may be said to have begun in 1969 and terminated with his death.

For Tsarouchis, as for many Greek artists, Paris was to become a second home. In 1936, on his first period of travels abroad, he met Matisse, Laurens, and Giacometti in Paris. His first one-man show was held in Paris in 1951 and in London later that year. Moreover, from 1967 to 1984 Paris was Tsarouchis's home. Between 1951 and 1957, he established a fruitful relationship with the Iolas Gallery in New York. Tsarouchis was probably the first Greek painter that could be classed as a European artist, but he by no means abandoned the long and multifarious artistic tradition of his homeland.

From Kontoglou, Tsarouchis learnt that inspiration is something totally different from tradition. In the 1930s one recognizes in Tsarouchis's works powerful influences from contemporary European painting, especially Matisse. Such influences, however, were harmoniously blended with elements drawn from the traditional Greek shadow theatre (*Karaghiozis*), from the art of the Greek folk painter Theophilos Chatzimichail, from Byzantine art, ancient Greek Classical art, and, of course, from the Egyptian Fayum portraits. All these influences are recognizable in most of Tsarouchis's output. His first main period is marked by youthful vitality and new ideas. His second period, however, from 1969, is more contemplative and attains a certain maturity, with memories of Renaissance art and, more particularly, of the art of 17th-century Italy. His canvasses combine the formality of Byzantine style with a use of colour and a freedom typical of the Renaissance. He also executed several works of a distinctive baroque flavour, and was particularly aware of Dutch painting as represented by Vermeer, but also of ancient Greek art via the Pompeii wall paintings.

Much has been said and written about the "Greekness" of Tsarouchis's work, especially of that executed in the 1930s. But nothing can replace the simple contemplation of the works themselves. Since Greece itself lies on the border between East and West, Tsarouchis strongly believed that national traditions could be used in a fecund combination with outside influences. He explains: "Do not accept it with enthusiasm nor reject it with hate, treat it as something inevitable." The artistic expression of this belief is evident in both periods in the thousands of variations he made on individual themes. Here, according to Tsarouchis, the world could be faithfully reflected. All his work, except for a short period of experimentation with cubism, surrealism, and abstract art, falls within this category.

Tsarouchis introduced Greek painting to a new repertoire of subject matter which reflected his basic thinking. Different types drawn from the life of the people: soldiers, sailors, and village women among the most popular. His central subject was the human being, most importantly the male nude. Much later, when he had isolated himself from people, he painted more and more landscapes and still lifes. He painted a disappearing world: the large Neoclassical houses and the grand coffee houses of Athens. In his works there is a tenacious sadness in the eyes of his fellow man. His art is a painted story, quite uneven, conservative yet revolutionary, somewhere between nostalgia and reality, imbued with a positive moral bearing and a conscious miniaturism.

Tsarouchis was also closely involved with stage design and the theatre in general. In 1935 he was stage designer of the National Theatre in Athens. Other theatres he worked with included the Theatro Khun, the ancient theatre at Epidaurus, the Dallas Civic Opera of Texas, Covent Garden in London, La Scala at Milan, the Olympico at Vicenza, and the National Popular Theatre of Paris. Tsarouchis designed the decor and costumes for Cherubini's opera *Medea*, which became a leading success for Maria Callas. Under his direction, Euripides' *Women of Troy* was staged in 1978 in the centre of Athens. With good sense and a new outlook on ancient drama, Tsarouchis transformed stage design in this field. In 1983 Aeschylus' *Seven against Thebes* was directed by him in Thebes. Both plays were performed in his translations from the ancient Greek. He also wrote humorous pantomimes.

Besides painting, the young Tsarouchis between 1935 and 1937 wrote surrealist poems that were published as a collection in 1980. In December 1986 a book of some 300 pages was published with articles he had written over the years about art and artists. Within two months it was in its third printing.

HANS HENDRIKX

Biography

Born in Piraeus in 1910, Tsarouchis was a pupil of Konstantinos Parthenis at the School of Fine Arts in Athens (1928–34). He was also an apprentice in the workshop of Photis Kontoglou (1930–34). He specialized in painting the male nude, landscapes, and still lifes. He lived in Paris 1967–84. He also designed and directed for the theatre. He died in Athens in 1989.

Turkey

The modern republic of Turkey was born from the ruins of the Ottoman empire after World War I, in 1923. Established partly in Europe (area of 23,623 sq km) and mostly in Asia (area of 756,953 sq km), it has a population of 60.8 million. European Turkey lies west of the Dardanelles, the Sea of Marmara, and the Bosporus; these link the Black Sea with the Mediterranean, giving the country control of important waterways. Asian Turkey, known also as Anatolia, with its fertile coastal plains constitutes the mainland. The geostrategic importance of the country "at a multifold crossroads between East and West, North and South, Christendom and Islam", and the fact that it was the main obstacle to Soviet expansion in the Mediterranean, "the southeast keystone of NATO during the Cold War", facilitated its integration into the Atlantic Alliance and its ties with western Europe and the United States.

There had been a close relationship between Greeks and Turks inside the Ottoman empire where Greeks lived for more than four centuries under Turkish domination. In 1923 Mustafa Kemal (later Atatürk) proclaimed the end of the Ottoman empire and created the nation state of Turkey. Encouraged by the hostility of some of the Allies (notably the French and the Italians) to Greece's presence in Asia Minor, Kemal refused to accept the Treaty of Sèvres signed by the sultan's delegation in August 1920. Receiving support from the Soviets who considered that the Greeks were acting on behalf of British imperialism, Kemal gained control of Anatolia. Abandoned by the British after Lloyd George's resignation, the Greeks were forced in August 1922 to evacuate Smyrna, which was sacked and looted. Greece had to absorb about a million and a half refugees under the terms of the exchange of populations. The Turks who were evacuated from Greece to Turkey amounted to fewer than 400,000. With the abandonment of the Treaty of Sèvres Greece lost Asia Minor, Eastern Thrace, and the islands of Imbros and Tenedos. Under the Treaty of Lausanne, signed in 1923, which confirmed these losses for Greece, Turkey renounced its claims on Cyprus in favour of Britain.

The debacle of 1922 remains a trauma for Greeks, the greatest national disaster since the fall of Constantinople in 1453. The Greek culture and population that had been established in Asia Minor for 3000 years were driven out. But the Lausanne treaty led to a normalization of Graeco-Turkish relations and a brief period of friendship followed.

Relations between the two countries later became hostile, however, and came dangerously close to a clash. A number of factors account for the deterioration of relations: the Turkish

invasion and occupation of northern Cyprus, the Aegean dispute, and the question of minorities.

As far as minorities are concerned, the exchange of populations was not applied to the Muslims of western Thrace or to the Greeks of Constantinople. About 250,000 Greeks remained in Constantinople and on the islands of Imbros and Tenedos, while about 120,000 Muslims stayed in western Thrace. The Greek minority in Constantinople suffered continual harassment. For instance, in November 1942 the emergency tax called *varlik vergisi* (wealth tax) was imposed upon the community, a measure that caused distress and loss of property. In September 1955 anti-Greek riots encouraged by government officials led to the destruction of many churches as well as Greek businesses and properties. Thousands of Greeks were forced to leave Constantinople in an exodus that marked the end of the Greek community there. After the coup d'etat of 1960 the Turkish prime minister Menderes and the foreign minister Zorlu were subsequently charged and found guilty of inciting the riots.

Nevertheless the harassment of the tiny Greek minority continued. In 1964–65, 9000 Greeks were expelled and the Turkish government confiscated their property. In addition, the Turkish authorities placed restrictions on Greek educational establishments and in some cases closed them. From the 250,000 Greeks living in Constantinople in 1923, their number has declined to an anaemic 3000 consisting mostly of elderly people, while the Muslim minority in Western Thrace has not only prospered but is represented in the Greek parliament. Greece and the Greek diaspora in the US have also raised the case of the mistreatment and harassment of the ecumenical patriarchate of Constantinople and the restrictions imposed on it contrary to the Treaty of Lausanne and international law.

Even though relations remain tense, Greece and Turkey are allies inside NATO and under American influence. Efforts are made from time to time to reduce tension and improve the relationship. Yet these efforts are hampered by several factors: the political instability in Turkey, the Kurdish situation, and the rise of Islamic fundamentalism. Movements towards a "re-Islamization" and "re-Ottomanization" of Turkey's foreign policy also hinder these efforts.

Only increased democratization in Turkey and a respect for human rights may help to establish better relations with Greece. As long as the country remains under military supervision with what is considered from a Greek point of view to be an expansionist foreign policy – in Cyprus, in the Aegean, and even in the Balkans – relations between the two countries will continue to be tense and may become worse. Nevertheless, if we take the example of Franco-German reconciliation in the postwar period, there is no reason to assume that Greece and Turkey will be rivals for ever and that beneficial cooperation between the two countries is impossible.

Tyranny

The word "tyranny" was almost certainly Lydian in origin. From its first use in Greek – in a fragmentary poem of the 7th century BC by Archilochus of Paros – it was associated with the kingdoms of the Near East. The speaker in Archilochus' poem denies any ambition for the wealth of the Lydian king Gyges or for a great tyranny: "these things are far from my eyes". The term was subsequently applied, however, to a number of Greek figures – Pheidon of Argos, Polycrates of Samos, Cypselus and Periander of Corinth, Cleisthenes of Sicyon, Pisistratus and Hippias of Athens – who came to exercise dominant positions within their cities in the Archaic period of Greek history (7th to 6th centuries BC). These men were, characteristically, fringe members of a ruling elite of their city who took power with the help of a faction of supporters. In some cases it is possible that they represented a body of those who felt excluded – due to their status or their geographical position within the city's territory – from the political constitution. The common view, however, that the Archaic tyrants were the product of a newly wealthy class of hoplites (or heavily armed soldiers) who felt that their contribution to the city merited a share in its political offices, is, at the very least, a caricature. Many tyrants seized power with no sign of any great ground-swell of support, sometimes with only a handful of men. Arguably tyrants were motivated by little more than a desire for glory and power.

There are some signs of the contemporary popularity of the Archaic tyrants. Stories of miraculous escapes from death or of their usurpation being forecast by miracles may suggest that their rule was seen as divinely sponsored. Later writers often dwell on the mild and constitutional nature of tyrannical rule: tyrants are seen as exercising an excessive influence on the selection of magistrates but allowing such magistrates to rule according to the constitution of the city – even though such constitutions were themselves probably very ill defined. Tyrants seem often to have initiated massive building projects; such largesse must have bought them popularity. Tyranny, nevertheless, came to be seen as archetypally unconstitutional, often contrasted with kingship, the archetypally constitutional form of monarchy. This view of tyranny was first defined in theoretical terms by the historian Herodotus in his *Debate on the Constitutions*, a discussion between three Persians, shaped also by a stereotypical image of oriental kingdoms, on the relative merits of oligarchy, democracy, and tyranny. The tyrant, according to the Persian Otanes, "disturbs the ancestral laws,

rapes women, and kills men without trial"; the unaccountability of a monarch will necessarily breed hubris and violence. Stories abounded of the crimes of tyrants, perhaps most colourfully of the bronze bull in which Phalaris of Acragas roasted his enemies.

Though some such stories may have a historical kernel, to a large extent they probably derive from the backlash subsequent to the fall of a tyranny. Tyrannical rule rarely lasted more than two generations. Inherited rule seemed perhaps more patently unjust. Stories of cruelty tend to be focused on the second rather than the first generation. In some cities – Corinth is the most prominent example – tyranny was replaced by a broader oligarchic clique. In Athens, however, the city for which there is the best evidence, tyranny was followed by democracy. The idea of tyranny indeed seems to have been defined in opposition to the ideal of accountable, democratic government. When the early 6th-century BC Athenian reformer Solon had warned of the threat of tyranny in Athens, he seemed to conceive that men might aspire to tyranny. The imaginary tyrant was an ever-present bogeyman of the democracy. The institution of ostracism (a period of ten years' exile imposed on leading politicians) was probably introduced, for example, as a safeguard against the excessive power of individuals in response to the expulsion of the Athenian tyrants. The charge of aiming for tyranny was one that was frequently laid against Athenian leaders, most famously Alcibiades.

The distinction between tyranny and democracy took on an additional sharpness of focus, and a patriotic gloss, in the light of the Persian Wars fought between the Persian kings Darius and Xerxes and the cities of Greece (490–479 BC). The Persians had been responsible for maintaining a number of petty tyrants in power within their sphere of influence in Asia Minor. The association of tyranny with the Persian enemy was ensured in Athens by the participation of Hippias, the expelled Athenian tyrant, in the Persian campaign that culminated in the battle of Marathon (490 BC). Already in Aeschylus' play the *Persians*, performed in 472 BC, the superiority of the Athenian system of government is seen as a crucial factor in the Greeks' victory. Like the tyrants of Archaic Greece, Darius, Xerxes, and subsquent Persian kings down to Darius III (the defeated opponent of Alexander the Great) were portrayed in an almost consistently lurid light: whimsically cruel, sexually decadent, surrounded by powerful queens and a population of slavish "yes-men".

In addition to the Archaic tyrants, another group of rulers are commonly referred to as tyrants: Gelon and Hieron of Syracuse in the 5th century BC and Dionysius I and II in the 4th. These Classical tyrants are usually seen as being very different in character from their Archaic counterparts: essentially military dictators, in the size of their power bases they preshadowed the rule of the Hellenistic kings who followed on from Alexander's conquest of the Near East. But just as in the case of the Archaic tyrants – where, however, the simultaneous appearance of so many figures lends the group an artificial coherence – tyranny is essentially in the eye of the beholder, an accusation rather than a position. The charge of tyranny was one that could even be turned against Athens. The Athenian writers Aristophanes and Thucydides (as well as the pamphlet often known as the *Old Oligarch*) reflect in their work the idea that the Athenian dominance over their allies in the 5th century BC also constituted a tyranny. A compelling argument makes out that Herodotus, writing his *Histories* in the early years of the Peloponnesian War, draws parallels between the empires of the Athenians and the Persians before them.

In the period of the Roman empire the charge of tyranny was regularly laid against imperial usurpers. A hostile tradition could even brand a successful emperor a tyrant: the Byzantine historian Socrates terms Constantine a tyrant. The same extremes of tyranny and freedom were predictably potent – though they took on a different colouring – in the period of the independence movement: the anonymous *Hellenic Nomarchy* of 1806 gave two explanations – the Church and the Greek diaspora – for why Greece was "bound with the fetters of tyranny". As Ypsilantis crossed the river Pruth between Bessarabia and Moldavia at the launch of the War of Independence in March 1821, he invoked the shades of Themistocles and Leonidas, the generals of the Persian Wars, in the struggle to bring "liberty to the classical land of Greece". Even today the assertion in Aeschylus' *Persians* that the Athenians are "slaves to no man", by implicit contrast to the Persians, is met in performance in Athens by rapturous applause – the result, arguably, of an equation of the Persians with a more recent enemy.

Tzanes, Emmanuel *c.*1610–1690

Painter and man of letters

Emmanuel Tzanes, whose surname was Bounialis, was a notable 17th-century figure. Known mainly as a painter, he

also wrote poetry (verses by him were published in Venice in 1668 and 1684) and composed religious services (for the saints Govdelaas, 1661; Joseph the Hymnographer, 1665; Theodora, 1671; Photini, 1671; and Alypios, 1679). He was distantly descended from a noble Cretan family and was brother of the poet Marinos Tzanes, who composed the extensive narrative poem *Cretan War*, and of Konstantinos Tzanes, also a painter. He was also connected to the Cretan priest and man of letters Kalliopios Kallergis.

Tzanes was ordained a priest before 1637. He probably fled from his native Rethymnon in 1646, the year in which that city was captured by the Turks. Between 1648 and 1656 he was in Corfu, executing numerous icons and collaborating with the painter Philotheos Skoufos. By 1658 he was in Venice, where he remained for the rest of his life. In 1660 he was elected parish priest of the Greek Orthodox church of San Giorgio dei Greci, which he served for approximately 20 years; for a short time he was also supervisor of pupils at the Flanginian School of the Greek Confraternity in Venice.

Tzanes had an active career of about 60 years (dated works range from 1636 to 1689), which came to an end only a few months before his death in March 1690. His oeuvre is large, comprising some 130 known works, and paintings by him are to be found in museums and other public foundations, private collections, churches, and monasteries in Greece (most of them in Athens, though some also on the mainland and the islands) and abroad (most in Venice, with a few in other European cities, St Catherine's, Sinai, and Baltimore in the US). Some works formerly thought to be by him have been shown to bear forged signatures, such as *St Anne Holding the Young Mary*, which is actually a 15th-century icon, and the icon of the *Allegory of the Holy Eucharist*, both in the Benaki Museum in Athens.

Tzanes executed paintings of differing sizes, shapes, and styles, ranging from small icons and triptychs to monumental paintings and large sanctuary doors. A conscientious and methodical craftsman, he had a strong grounding in the tradition of Cretan painting, which he had studied at Rethymnon before his flight to Corfu. Equally competent in both miniature painting and monumental art, and trained in both the traditional and more modern style, his artistic background enabled him to respond to the demands of a public of varying social status and tastes. His clientele came from both the secular and the religious world and included Greek Orthodox and Catholics. Among the latter was the Venetian overseer (*provveditore*) of Rethymnon, Andrea Corner, for whom an icon of the Virgin was commissioned from Tzanes in 1645 (Venice, Giudecca, Santa Trinità).

Tzanes sometimes depicted his patrons in his works (*St Demetrios on Horseback*, 1656, Loverdos Collection, Byzantine Museum, Athens; *St James*, 1683, Museo dell'Istituto Ellenico, Venice; *Triptych*, Kanellopoulos private collection, Athens), rendering these secular figures quite successfully with personal features and wearing contemporary dress. He frequently includes a date on his icons, contrary to usual custom, which enables us to trace the enviable continuity of his output virtually year by year from 1640 to 1689, and to document the various phases of his work. His art does not exhibit any spectacular development.

Tzanes brought a rather different approach to a tradition that covered about two centuries of Cretan artists painting in the Byzantine manner, adopting Western iconographic and stylistic elements. He shows a marked preference for iconographic innovations, although he also executed a large number of traditional subjects. Sometimes he returns to subjects that were very popular in the 15th century, repeating them with minor changes or additions (*Virgin with the Symbols of the Passion*, *Christ Enthroned*, a full-length *St John the Baptist*). He also makes use of details from much earlier Cretan painting, such as the characteristic dotted haloes, though he gives them richer floral decoration. Essentially he is an exponent of the Byzantine tradition, which he attempts to enrich with new elements. At the same time, he created new iconographic types, modifying and varying the traditional elements and enriching his repertoire by selecting and transforming features borrowed from works of the late Renaissance and Mannerism, and also from engravings by the Flemish Sadeler brothers and other artists. Architectural and sculptural elements are derived from Renaissance and Baroque art, but the poses and movements of his figures show Mannerist features.

Tzanes had a varied repertoire, despite the fact that he painted individual saints much more often than narrative scenes. Some of these saints were clearly favourites, such as *St Alypios the Stylite*; *St Govdelaas the Persian*, whose iconographic type he created and established, and was even the subject of an engraving executed in Venice in 1681; and *St Demetrios on Horseback*. He also painted many icons of the Virgin and of Christ, enthroned or bust-length, and in a variety of iconographic types. Icons notable for their monumental size or of particular iconographic interest include: the icon of *St Spyridon*, with charming miniature scenes from the saint's life – the earliest (1636) dated work by Tzanes (Museo Correr, Venice); the *Annunciation*, flanked by ten other scenes in a smaller scale (1640, Berlin); the *Tree of Jesse* (1644), an old subject given a new treatment (Museo dell'Istituto Ellenico); the *Virgin and Child Enthroned* (1664) and the corresponding icon of *Christ Enthroned* (1664) in the Byzantine Museum in Athens, which repeats, with minor additions, the type used by the painter Angelos (first half of the 15th century, according to recent research); the *Adoration of the* Magi (1667; Loverdos Collection, Byzantine Museum, Athens), obviously based on an engraving (1585) by J. Sadeler after a composition by Martin de Vos; *Sts Constantine and Helen with the Cross* (1669, Loverdos Collection, Byzantine Museum, Athens); *Christ Pantocrator Enthroned* (1678, Kato Panayia Monastery, Arta); the *Virgin Lambovitissa Enthroned* (1684, Loverdos Collection, Byzantine Museum, Athens); the *Miracle of the Holy Girdle of our Lady* (Benaki Museum, Athens); and the *Virgin between Sts John the Baptist and Philip* (Baltimore). Three large sanctuary doors preserved in Corfu and dated 1654 (St John of Damascus, St Cyril, St Gregory Palamas) contain inscriptions with a reference to the procession of the Holy Spirit from God the Father.

Works of interest for their narrative character and the treatment of the background, with the scenes set in a landscape or accompanied by buildings include two scenes of Christ's miracles: the *Healing of the Paralytic* and the *Healing of the Blind Man* (1682 and 1686), and also *Christ and the Samaritan Woman* (1689), the *Incredulity of Thomas*, and the

Appearance of Christ to the Holy Women Bearing Myrrh, the two last undated (all in the Museo dell'Istituto Ellenico). This group of five paintings is also of iconological interest, in that it is a visual representation of the Gospel passages for the five Sundays after Easter, until Ascension Sunday, which come from St John's Gospel. The *Entombment* (1677, San Giorgio dei Greci, Venice) has an unusual form: it is painted on both sides and the background is cut away around the figures. The work is still used as a processional icon during Good Friday of the Orthodox Easter.

Tzanes follows the traditions of the Cretan school, but his modelling is more calligraphic and he includes picturesque details; his use of line is distinctly decorative, occasionally producing a dry style, or a sweetish expression and loose gestures. He clearly admired the compositions of Michael Damaskinos, though he lacked this painter's compositional abilities, and his drawing and painting were weaker. His technique is flawless and he gave great attention to detail, leading to a degree of pedantry, and his style recalls that of Emmanouil Lambardos, an older fellow-Cretan artist. The decorative charge that inundates many of his works is often carried to the point of affectation: great attention is paid to the treatment of fabrics and the details of thrones (*Enthroned Virgin and* Child, 1650, Corfu; *St Cyril*, *St Gregory Palamas*, and *St John of Damascus*, all 1654, Corfu; St *Basil*, 1667 and *St James*, 1683, both in the Museo dell'Istituto Ellenico), and there is distinct eclecticism in the western elements. His workmanship, with its delicate modelling and large number of white highlights (*psimmythies*), produces meticulous results (e.g. the *Holy Mandylion*, 1659, formerly in a private collection and now in the Benaki Museum), and bright icons that are nevertheless rather academic in style. Among the most positive features of Tzanes's paintings are the brilliant colour combinations that create pleasing, though occasionally cold, ensembles. Generally speaking, he prefers symmetrical compositions. He essays a few timid steps in the articulation of space and the perspective rendering of buildings, though without fully grasping the problems. In this, too, he follows the line of Damaskinos, though not particularly successfully.

A bearer of the Byzantine tradition in his calling as priest, and also as composer of religious services and an individual with a genuinely religious character, Tzanes reveals himself as a more complex personality through his painting. Though a conservative at bottom, his leaning towards western European art and iconographic amalgams makes him a representative of certain regenerative trends in Greek 17th-century painting. His work was accordingly much appreciated and his style exercised a great influence on post-Byzantine religious painting.

Biography

Emmanuel Tzanes, whose surname was Bounialis, was born to a cultivated family at Rethymnon in Crete *c.*1610. He was ordained a priest before 1637, and in 1646 (when Rethymnon fell to the Turks) he fled to Corfu. By 1658 he was in Venice where he remained for the rest of his life, serving as parish priest of the church of San Giorgio dei Greci *c.*1660–80. He had a long and distinguished career as a painter. He died in Venice in 1690.

Tzetzes, John

Scholar of the 12th century

John Tzetzes was a Byzantine scholar and teacher who has a certain importance for the tradition of Classical Greek literature, because he preserved some otherwise unknown fragments of ancient authors. His writings also provide rich biographical material.

Tzetzes was born in Constantinople around 1110. His mother's family originated from Georgia (Caucasus); his great-grandmother had accompanied the princess Mary of Alania from Georgia to the capital. His father was a Greek, whose "Hellenic" roots Tzetzes proudly mentioned in a letter. He had several brothers, of whom only Andronikos and Isaac are known by name. John's father appears to have been an educated man, because he acquainted his son with a wide range of Classical literature (Tzetzes later compared him to the elder Cato, who had instructed his son in a similar way). His brother Isaac was also interested in ancient literature and a commentary on Pindar is evidence of his scholarship; he died at Rhodes returning from a military campaign in the eastern parts of the empire. Tzetzes first found employment in the provinces as a secretary in the office of the governor Isaac Komnenos in Verroia (Macedonia), but he had to give up his job because of an affair he seems to have had with his employer's wife.

He later referred to this experience several times, accusing the woman of having ruined his career. Leaving Verroia, he returned to Constantinople, where financial necessity forced him to sell his library piece by piece – a manuscript of Plutarch's *Parallel Lives* was the last remaining book, as he laments. He started to earn his living by teaching (parents who could afford it would send their children to a grammarian for primary lessons). In one of his letters he describes a scene in his classroom: some pupils are reading and interpreting a passage of Homer; they are divided into different levels, from beginners to advanced students. In addition he gave lectures on various Classical topics. The scholar became a respected teacher and a tutor to members of distinguished families. Finally he was chosen by the emperor Manuel I Komnenos (1143–80) to instruct his wife Irene, the former German princess Bertha of Sulzbach. Tzetzes had to acquaint her with the literature of her

new home and was charged to prepare a commentary on the Homeric poems. But he did not finish this work: discontented with the delay in his payment, he gave up this position. He finished the commentary only several years later, encouraged by his friend Konstantinos Kotertzes.

We do not know exactly why Tzetzes moved to the Pantokrator monastery in Constantinople. It seems likely that he had run into trouble by joining the supporters of patriarch Kosmas II Attikos who was deposed at the synod of 1147 because of his contacts and sympathies with heretics. At the monastery of the Pantokrator, founded by John I Komnenos in 1136, Tzetzes continued to teach monks. Some of his last letters deal with the monastic life. He died there after 1165.

The main source for reconstructing Tzetzes's life – besides some autobiographical notes in other works – is his correspondence, which he arranged himself and put into chronological order. He also commented on various topics mentioned in his letters and published them as the *Histories* (*Historiai*). N. Gerbel, the first editor of this commentary, divided it into 12 parts, each containing 1000 verses, and titled it *Chiliades* (from *chilioi*, "thousand"). This work, written in political verse (the Byzantine 15-syllable metre), is a thesaurus of Tzetzes's enormous knowledge of Classical literature and history.

There are also commentaries on Homer. Tzetzes wrote a hexameter poem describing the situation before, during, and after the fall of Troy (*Antehomerica*, *Homerica*, *Posthomerica*). He also interpreted Homer by allegories (*Chronike Biblos*). Finally he commented on Aeschylus, Aristophanes, Euripides, Hesiod, Lycophron, Nicander, Oppian, and Porphyry.

As far as we know, Tzetzes gave no public lectures, but he composed some funeral orations for members of the emperor's family and high officials. Although he is often accused of quoting inexactly, he remains an authority on Classical literature.

MICHAEL GRÜNBART

Biography

Born in Constantinople *c.*1110, Tzetzes's mother's family was Georgian but his father was Greek. His father taught him ancient literature. Tzetzes first worked for Isaac Komnenos in Verroia. Returning to Constantinople he lived by teaching. Later he moved to the Pantokrator monastery where he taught the monks. He wrote letters which he prepared for publication with a verse commentary. He also commented on Homer and other poets. He died after 1165.

U

Ukraine

It is now thought that Greeks from Miletus first settled in the Ukraine in the course of the 6th century BC, though a century earlier has been claimed. Settlement was either coastal or along the banks of the major rivers of the region and their estuaries. By about 550 BC the town of Olbia was established near the modern village of Parutino, on the west shore of the estuary of the river Bug (the Greek Hypanis), when an agora and religious precinct were laid out. Numerous minor Greek settlements fringed the whole estuary around Olbia, while the islet of Berezan just beyond the mouth of the estuary had been settled at the same time as Olbia itself, if not a little earlier. The island was named Borysthenes by the ancient Greeks, as was the great river Dniepr which emptied into the Black Sea immediately to its east, beside the Bug. The name Borysthenes was also attached to Olbia itself, especially in more literary accounts of the town, such as that of Dio Chrysostom, composed about AD 100 (*Oration* 36). Dio's gloomy account is not to be taken at face value, as archaeology now shows: it is designed to make a philosophical argument about civic culture and harmony, for presentation at Prusa in northwest Asia Minor. Later, in the 10th century, the Byzantine emperor Constantine VII Porphyrogennetos (913–59) in his famous survey of his realm looked upon the Dniepr as the principal highway to the first Russian state, the Rus of Kiev, and beyond as far as the Baltic. It was down this river that furs, amber, and mercenaries came into the Byzantine world, including the Varangian bodyguard of the emperor himself.

The hinterland of the Crimea was a continuation of the Ukrainian steppe to the north: Greek settlement followed its coast. The largest Greek cities were Chersonesus (modern Sebastopol) in the southwest Crimea and the cities of the Bosporan kingdom that formed its eastern part, especially Panticapaeum (Kerch) and Theodosia. Recent work has indicated Greek settlement also on the northeast coast, on the shallow Sea of Azov, which was dominated by the Bosporan kingdom as far as the Don (the Greek Tanais). The Greeks reasonably treated Azov as a lake and named it Maiotis.

Chersonesus offered excellent harbours, but seems not to have been established as a Greek settlement until about 422 BC, when settlers came from Heraclea Pontica. No doubt the local Tauri, famously ferocious, were a main reason for earlier neglect of the site. It was here that Euripides set his *Iphigeneia in Tauris*, first performed in Athens about 412 BC and a very popular theme in art thereafter. Euripides' version of the myth stresses that the cult of Artemis at Halai Araphenides (modern Loutsa in Attica) took its origin and ritual from the Taurian form of the cult.

Chersonesus (then Kherson) remained a strong outpost of the Byzantine empire after much else in the region had been lost. It was here that Cyril and Methodios wintered in AD 860/61 en route to the Volga Khazars. Here too in 989 prince Vladimir of Kiev was baptized and married to a Byzantine princess: this was the beginning of the Russian Orthodox Church. Not far from Chersonesus lay the promontory that gave its Greek name to the Crimea, the Ram's Head (Kriou Metopon).

Theodosia was founded by Milesian Greeks in the 6th century BC on the southeast coast of the Crimea; for the Byzantines it was Theodosioupolis, and later for the Genoese the great trading port of Kaffa. In the 4th century BC much of the grain imported into Athens seems to have come from Theodosia and its hinterland. At the eastern extremity of the Crimea lay Panticapaeum, the capital of the Bosporan kingdom. It too was established in the 6th century BC by Milesian Greeks. About 438 BC the Spartocid dynasty formed the Bosporan kingdom, which embraced both the eastern Crimea and the Taman' peninsula across the straits of Kerch to the east. It was to last into the 3rd century AD. Pericles, who led an expedition to the Black Sea in the 430s BC, may have played a role in creating the dynasty. Certainly, Athens subsequently developed close social and economic ties with the kingdom, whose rulers could even receive Athenian citizenship in the 4th century BC. Although Bosporan rulers had other cultural allegiances (Iranian and perhaps Thracian), the language and principal culture of their realm were firmly Greek throughout its history.

Across the whole region and through most of their history Greek communities of the Ukraine had to come to arrangements with local populations who were often nomadic – Scythians, Sarmatians, Goths, and others. For the most part, the Greek literary tradition stresses hostility with these peoples, while epigraphic and archaeological evidence reveals also more friendly or at least structured interaction and exchange, including formal treaties. The great ramparts across the breadth of the eastern Crimea, with which the Bosporan kingdom shielded itself, indicate the significant threat of

assault by land. However, in surveying the region in book 4 of his *Histories*, Herodotus observes the existence of Scythian–Greek intermarriage and mixed populations, as near Olbia. He also describes a Hellenized settlement in the Ukrainian hinterland (perhaps modern Bel'sk), settled by the Geloni, whom he regards as of Greek descent, but as in his day speaking a language that is a mixture of Scythian and Greek (4. 108–09). No doubt Greeks of the region mediated exchange between the Scythians and the Aegean world: it was presumably through the Greek settlements of the region that the Scythian archers came who maintained public order for 5th-century Athenian democracy. For the Greeks of the Aegean the whole region was a reservoir of resources (slaves, grain, leather, and other goods).

From the perspective of the mainland Greeks the Ukraine was viewed as significant also for its peculiar geography and climate. The flat grassy steppe was contrasted with Greek landscapes, while the great rivers of the region had few parallels among the rivers of Greece. The climate was imagined as very cold, rather colder than it was in fact. The medical writers in particular viewed the region as a source of enlightenment about the effects of severe cold on the human body, for example in reducing fertility. The fate of Greeks in the Ukraine in modern times replicates that of Georgia.

Uniates

"Uniates" is the name given to the entirety of the flock of those Churches of eastern Christendom that are in communion with Rome. In their ecclesiastical life they still retain their own respective rites, languages, and customs. After the great schism between the Churches of the East and the West (1054) several attempts were made at reunification. But they were not successful, and the gap between the Churches widened after the sack of Constantinople by the Latins of the Fourth Crusade (1204). The latter dismembered the empire into numerous Frankish territories, while the Church of Rome established Latin patriarchates in Constantinople, Antioch, and Jerusalem, under its jurisdiction. The Franks, the political rulers, forced the Orthodox clergy to take an oath of devotion to the Roman pontiff. A number of Orthodox clergymen took this oath; others refused; while a third group among them rejected the unilateral solution of the oath and suggested the convocation of an ecumenical council. The council was convened in 1215 in the Lateran, but no Orthodox clergy were present. Evidently no discussions took place, as the intermediate faction had hoped. But since the Catholics had prior knowledge of the Orthodox reaction, they decided not to impose the Latin rite on them. The Orthodox would be allowed to keep their doctrine, liturgy, language, and customs in their ecclesiastical life. Nothing would change in their traditions, except for a fundamental element: their subjugation to the pope of Rome. This decision of the Lateran Council constituted the beginning of the Unia.

The advance of the Ottomans into Asia Minor gave a political and a military dimension to the move towards the unification of the Churches. Despite the favourable decisions taken in this direction in the context of several councils (e.g. the Council of Lyon in 1274 and the Council of Ferrara–Florence in 1439) convened by the political and ecclesiastical authorities of the East and the West, the union of the Churches that was decided on remained temporary. Already before the fall of Constantinople to the Turks (1453) prominent clerics and a large number of lay persons denounced the unification. Besides, the West failed to provide military assistance. Immediately after the fall, Turkish policy was hostile to unionist tendencies. Apart from that, the sultan Mehmet II the Conqueror selected as patriarch George/Gennadios Scholarios, who had become anti-unionist, following the Council of Ferrara–Florence.

Rome practised proselytism even towards the followers of other Orthodox Churches using the same method, that of Unia. On several occasions, in fact, its politics were backed up by military action, as well as by alliances with other states. Poland, for example, having the Ukraine under its rule, protected the Jesuits in their efforts to force the Orthodox inhabitants into a unification with Rome. In Poland the term "Uniati" was used for the first time. The synod in Brest (1596) was divided into two camps: the Orthodox and the Uniates.

The Polish king Sigismund ratified the decisions of the latter, while he launched a persecution against the Orthodox, who asked the Greek patriarchates of the East to help them. It was then that Cyril Lukaris was sent to Poland, where he recommended the founding of schools and printing houses. The Jesuits attempted to proselytize the Russians. As their pawn, they used a Russian monk, who because of his resemblance to Dmitri, the deceased last descendant of the Rurik dynasty, managed to ascend the Russian throne with the help of the Poles (1604–06). (He is better known as False Dmitri.) The people revolted and executed him. Sigismund of Poland invaded Russia, occupied Moscow (1607), annexed Russian territories, and imposed unification with Rome on the Russians. A period of upheavals followed, until Michael Romanov became tsar (1613) and put an end to Western intrusions.

The Uniate tactic of proselytizing the Orthodox was also employed towards other confessions of the East. Thus, several oriental rites were formed, which are distinguished as: the Alexandrian rite (for Copts and Ethiopians); the Antiochene rite (Malankarese, Maronite, and Syrian Churches); the Chaldean rite (Chaldeans and Malabar Christians); and the Armenian rite. The Uniates who come from the ranks of the Orthodox call themselves Greek Catholics or followers of the Constantinopolitan or Byzantine rite. The individual faithful are divided into national community Churches, such as the Albanians, Byelorussians, Bulgarians, Georgians, Greeks, Italo-Albanians (in southern Italy), Serbs (in Croatia), Melkites (in the Near East), Romanians, Russians, Polish Ruthenians (now called Ukrainians), and Podcarpathian Ruthenians. Among the Greek Catholics, there are also a number of Chinese, Estonians, Latvians, Finns, Japanese, Slovaks, and Hungarians. After World War II the Greek Catholics of the Ukraine and Romania were forced by the state to join the Orthodox Church. They were legalized in 1989 and 1990 respectively. In 1990 a Code of Canons for the Oriental Churches was issued in Rome. According to data that were published in Rome by the Sacred Congregation for the Oriental Church in 1962, the total number of Uniates was estimated at 8 million. In Greece the Greek Catholics number approximately 2,500 and are subject to the Apostolic Exarchate in Athens.

CHARALAMBOS K. PAPASTATHIS

See also Papacy, Roman Catholic Church

Summary

Uniates are members of those Churches in predominantly Orthodox societies that are in communion with Rome. They retain their own rites, languages, and customs but take an oath of devotion to the pope. Those Uniates who come from the ranks of the Orthodox call themselves Greek Catholics. In Greece itself they number today about 2500.

Urbanization

When Aristotle famously described man as a political animal the strict meaning of the Greek – *politikon zoon* – is "an animal that lives as part of a polis", that is, a member of what is usually translated as a "city state". Latinized he would be an urban creature. The implication is that urbanization, the forming of cities, is the natural way of life for a Greek community. In its simplest form, this is true. In both ancient and modern Greece people prefer to live together, forming communities, rather than isolated in individual homesteads. An obvious original reason for this is the need for security; isolation is potentially dangerous, particularly in unsettled times. On top of this, though, come the social reasons: the need to belong, to be part of the whole, rather than a self-contained individual. Human fulfilment required the larger grouping.

This in turn requires an understanding of the communities, the poleis. There is no implication of great size. Many of the city states in Classical Greece are more readily defined as villages, rather than cities in the sense of modern urban sprawl, while at the same time the population was not necessarily concentrated in a single urban centre; in the largest of them, Athens, the majority of the citizens lived not in the city of Athens, as defined by its encircling fortifications, but in outlying villages scattered throughout the various regions of Attica. It was the village that formed the essential starting point. It was from this that urbanization, in the strict sense, started.

Urbanization was a response to the political condition of the times. The earliest urban communities of Greece developed in the Middle and Late Bronze Age, initially in Crete. They vary in size, from Gournia, no more than a village in modern terms, to the much larger (and still mostly unexplored) communities at places such as Knossos. All centred on the architectural complexes usually termed palaces, presumably the residences of monarchs but including the administrative (in all senses), economic, and religious functions that their owners represented. Similar urban groupings, some much larger then the Cretan examples, are, of course, found in the Near East at an even earlier date; there is every likelihood of direct influence on Crete, just as in the same way the Cretan examples influenced similar developments in mainland Mycenaean Greece. What is uncertain, in what is essentially a prehistoric context, is the relationship between the palaces and the urban areas surrounding them. Some of the "villas" or "mansions" (terms applied by the archaeologists who have explored them) round the palace at Knossos are substantial and opulent, but it is unclear whether they were "official" buildings or the residences of well-to-do individuals. Similarly, houses outside the palace at Mycenae have been attributed to merchants, though again the ownership is unclear.

What is certain is that with the destruction of the palaces and their organization the urban centres collapsed; in the succeeding Dark Age it is assumed – there is little archaeological evidence – that a village pattern resumed. Some of these villages were the settlements of newcomers. Those that coalesced into the city state of Sparta, which retained their village form long into the Classical, historical period, are a good example. Others were formed by survivors from the earlier populations, and for these, in mainland Greece, the heavily fortified citadels that surrounded the sites of the former palaces often became the urban nucleus. Some (Mycenae) hardly outgrew their citadel. Others (Athens) from an early date spread over the lower ground below the Mycenaean citadel walls of the Acropolis. It was all this that developed as the urban centre for the enlarged city state, which came to include the other villages of Attica.

Thus in Classical Greece urbanization meant the provision of an urban centre rather than simply a place of residence for an enlarged population. Compared with a modern city, a much greater proportion of the area within a city's defined boundaries was devoted to public building, religious, economic, administrative. It included places, which may or may not be actual buildings in the architectural sense, where the citizens could gather for political or religious purposes. The central "gathering place", the agora, in Athens was the place where in the 5th century BC the citizens collected when they voted to banish (ostracize) politicians who had lost their favour, while on the adjacent hill of the Pnyx was the open-air location for the political assembly, the Ekklesia. Those who attended came from the whole of Attica, not merely the city itself. Within the urban area the Acropolis (now demilitarized, the city fortifications instead now including the whole town) formed the gathering place for the entire population of Attica when they came to worship Athena at her annual festival. With the growth of wealth and the desire for prestige that came with it, the city was embellished with fine buildings, to modern thinking completely out of scale compared with the size of the actual population dwelling within the walls.

A further stage in urbanization was the deliberate, planned construction of cities. This started in the colonies that the Greeks founded overseas, where the settler community was concentrated in the urban centre, the outlying land being allotted to them, often with non-Greek inhabitants to work it for them. Such artificial cities are easily recognized by the use of a regular grid plan for their street system, facilitating the allocation of equal-sized individual plots to the settlers. Himera, in Sicily, is an excellent example of such a city. The concepts involved in this were elaborated into theories of urban planning and the proper form a city should take, with the emergence of individual town-planning experts, the most famous of whom was Hippodamus of Miletus. He may have been responsible for the planning of his native city when it was recreated after its destruction by the Persians; he certainly planned the new harbour city of the Athenians at Piraeus. The basis of his theories was the inevitable grid plan of streets, but planning extended also to the proper location of the different areas and structures a city requires.

Thus during the 5th and 4th centuries BC a new category of urbanization developed, the deliberate bringing together of people from a wider area and its villages into a large, planned urban centre. The motives were various, but the underlying purpose was to create more powerful communities. The city of Rhodes, formed by the amalgamation and transfer of population from three older poleis, Lindus, Ialysus, and Camirus, embraced a large area within strong fortifications, though it seems never to have been fully built up. Other cities were moved to new, planned sites, such as Priene and Cnidus, these perhaps at the behest of a foreign ruler, Mausolus of Caria. By the 4th century BC urbanization, often on a substantial scale, was considered an ideal; it formed a crucial element in propelling backward areas, such as Macedon, into the forefront of up-to-date powers, even if politically they adhered to the older concept of monarchy. A culmination comes with the laying out of Pella as the Macedonian capital. Here urbanization created a spacious city, with broad streets, proper drainage and water supplies, and opulent houses. No doubt it represented a considerable improvement in the standard of living for the people who came to inhabit it; at the same time they were content with a regime that controlled them, rather than a political system under which they governed themselves.

So the Greek city was transformed from a political to an urban organization. In the Hellenistic period, and following the conquests of the Macedonian Alexander the Great, this was extended, and many more urbanized places were organized. Some of these were too artficial, too remote from a natural raison d'être, and failed (though one of the remotest, Aï Khanum in Afghanistan, was remarkably successful). Others prospered. In Greece itself Cassander's foundation of Thessalonica was one of the triumphs of the urbanization movement. In the newly conquered areas the greatest of the Alexandrias founded by Alexander the Great, that "next to" (rather than "in") Egypt, to use the official nomenclature, became one of the greatest cities of the whole ancient world. Urbanization was a policy that was synonymous with the concept of Greek political superiority and domination.

Even after the collapse of the Hellenistic monarchies, the Romans continued the policy of urbanization, using the cities as an essential method of local political control, extending the policy to the non-Greek parts of their empire. The Hellenistic and Roman periods thus saw the apogee of Greek urbanization. The cities played a vital role in the political and economic order of things, and were rewarded accordingly. Where the Classical cities had built for the gods, the Hellenistic and Roman cities built for man; or at least, those men who were privileged to be part of them. Public buildings were constructed on a magnificent scale. The agoras were lined all round with stone colonnades (stoas), behind which were shops, offices, rooms for dining and feasting. Each city had its theatre; its gymnasia – which became places of education – were no longer mere open fields, but colonnaded courtyards, with assembly rooms and running courses (that at Cyrene roofed to provide shade from the African sun). Streets were wide, and paved; in late Hellenistic and Roman cities they were monumentalized with long lines of columns. Water supplies were, where necessary, piped in (Priene affords a 4th-century BC example of this), or, where suitable springs were not available, stored in specially built and often cavernous cisterns (Alexandria). Much was done at the expense of the kings and the Roman emperors who succeeded them. Where cities fell back on their "own" resources, this often meant the pockets of

the well-to-do, from whom lavish public expenditure was an expected duty.

In many senses the heyday of Greek urbanization was the 2nd century AD; the worsening conditions of the 3rd century brought an end to much urban development (it has been suggested that excessive expenditure on urban amenities hastened, or even created, the economic collapse of the mid-3rd century AD). Even so, the concept of the urbanized ideal continued, so that when the emperor Constantine founded his New Rome at Constantinople, it was conceived on the grand urbanized scale, with the same lavish amenities, as in earlier times. Constantinople flourished as the new imperial centre. Other Greek cities declined, impoverished by the Byzantine financial system, or the victims of political change. A few survived right through the Middle Ages, though often much reduced, such as Thessalonica. But even the greatest, Alexandria, dwindled to a small town, though the ghost of its vast Hellenistic grid plan was still discernible in the sands as late as the early 19th century. Under the Turks, Athens was a small, squalid town huddled against the north slopes of the Acropolis.

The revival of urbanization came with the liberation of Greece from the Turks. Athens was deliberately extended as the capital of free Greece (though the inevitable grid plan, despite the magnificent broad main street, Panepistemiou, is now a traffic nightmare). Other Classical cities were revived, as centres for the new Hellenism. None of these places reached any great size in the 19th century. Athens continued to be separated from its (equally revived) harbour town of Piraeus by open country and olive groves as late as the 1950s. A new and unplanned impetus for urbanization was the Asia Minor disaster of 1922, when refugees arrived at the principal centres, creating new, unplanned extensions to the existing cities, particularly Athens and Thessalonica. But on top of this, modern economic pressures, the creation of factories and employment, turned the cities into magnets, drawing ever-increasing populations from the rural areas, and putting enormous strain on what must now be termed the urban infrastructure. Now, Greek urbanization needs to be rescued from its own success.

USA

In spite of the scarcity of relevant records, it is widely believed that several Greek immigrants landed in America – mostly as members of Spanish crews – in the very early years of its colonization, mainly driven by a spirit of adventure. The first Greek recorded to have arrived in the New World with the Spaniards was a certain Theodoros who landed at Tarpon Springs in Florida in 1528. The records have also registered that the first Greek coffee house was established in New England in 1652.

The first organized settlement comprising about 500 Greeks, as well as Minorcans and Italians, was established in the 1760s in the wilderness of Florida by John Turnbull, a British citizen, with generous help from his king and government. The colony was named New Smyrna, after the birthplace of Turnbull's Greek wife, but it hit difficulties from the very beginning mainly due to the hostile wilderness that surrounded it, as well as insufficient provisions, short supplies of food, malaria, excessive labour demands, and a general mismanagement and lack of human consideration for the settlers. However, a significant number of Greeks survived the hardships and carried on as an ethnic group in the region with John Giannopoulos as their teacher; his house – subsequently restored – is registered as the first schoolhouse in America.

However, these first Greeks seem to have disappeared by the early 19th century. The new century brought new arrivals – the records give 20 for 1821–30, 49 for 1831–40, 16 for 1841–50. The Greek War of Independence against Turkey, which had started on 25 March 1821, had also attracted a lot of attention in the New World which offered substantial help for the cause of Greece either by sending fighting troops or by bringing many Greek orphans to America. As a rule, the Greeks who settled in the United States before the mid-19th century made little effort to retain their ethnic identity. Yet, many among them managed to develop unusually successful careers and so they helped foster a positive image of Greece and of Greek identity in other Americans. Examples include Evangelidis Apostolidis Sophocles who became professor of Ancient, Byzantine, and Modern Greek at Harvard University in 1842, Georgios Perdikaris who was appointed United States consul in Athens in 1845, John Rodonaki who was Greek consul in Boston from 1850 to 1872, and Michael Anagnos who married into a highly respectable Boston family and became director of the Perkins Institute for the Blind in 1872.

From 1880 onwards, Greek immigration rates to the United States started rising sharply and reached a peak between 1890 and the late 1920s with a mass exodus of what is estimated to be one third of the total labour force of Greece at the time. Statistical figures give 173,513 immigrants for 1900–10, 196,119 for 1911–20, 91, 369 for 1921–30, and 9138 for 1930–34 – although one has to take the figures only indicatively.

The earliest waves of this systematic immigration came from the Peloponnese, especially Laconia and Messenia, as early as the mid-1860s. However, the point of exodus soon spread to the mainland (mainly Attica, Boeotia, Phthiotis, and Phocis), and in the 1900s and early 1910s emigration from the northern parts of Greece, which were fighting their own war for independence, was particularly heavy. The last massive wave of immigrants was about to surge during the years following the defeat of the Greeks in Asia Minor (1922), when masses of Greek refugees from the wider area were directed to the States, just as Greece itself was unable to accommodate them all. But American views and laws on immigration had already toughened: by 1917 Greek and other immigrants realized that admission into the USA was no longer based on the individual concerned, but was based on racial and ethnic discrimination, while the Immigration Act of 1921 – limiting the number of each country's new immigrants to 3 per cent of its natives already living in USA – was a further blow to Greeks, who had only recently begun to enter the country in substantial numbers.

In fact, the Greek immigrants of the late 19th and early 20th centuries were part of the second substantial immigration wave which is associated with the USA during the second half of the 19th century and which supplied the country with newcomers from southern and eastern Europe, mostly fleeing depressed economies and oppressive governments. They were thus faced with a certain anti-foreign sentiment, which had developed against them not only among long-established Americans but also among the many immigrants of the first wave who were on their way to becoming Americanized. This first large-scale immigration had taken place in the mid-19th century and comprised immigrants coming primarily from Germany, the British Isles, Norway, and Sweden. Fair-skinned and usually Protestant, these new inhabitants blended fairly quickly into the American mainstream and gained relatively easy acceptance from their American neighbours.

The great majority of the Greek immigrants were men in their late teens or early twenties, most of them shepherds, farmers, merchants, and fishermen with minimal education who were mainly seeking to escape the compulsory military service in those turbulent times, or the dire economic conditions currently prevailing in Greece, especially after the humiliation of the 1897 war and the economic sanctions imposed by the European forces. There was also a small proportion of women among them seeking husbands without demand of dowry. Even though from a rural background, almost all felt a strong aversion for agriculture, due to their painful recollections of it, and so they gathered in the northeast (New York, Chicago, Washington, Massachusetts) facing the hard competition for industrial jobs and troubles connected with their ignorance of the English language and with the antagonism from the earlier immigrants mentioned above. Some of the earliest arrivals peddled cigars, flowers, or sweets from push-carts, or became bootblacks or dishwashers. Some more adventurous newcomers headed for the western frontier, to Nevada, Utah, and California, taking jobs in the mines or laying track for the transcontinental railway that was being constructed.

In spite of the hardships, America remained for years the dream destination for thousands of impoverished Greeks, most of whom were seeing their immigration to the US as a temporary stay that would earn them enough money to pay off debts or the mortgage on the family property before coming back home. With the exception of the period just before and during the Balkan Wars of 1912–13, when restrictions were imposed on the emigration of Greek males capable of fighting, the Greek government directly or indirectly encouraged emigration, often misleadingly glorifying the achievements of the Greeks in the New World and avoiding references to their failures, for obvious reasons: according to a bulletin issued by the Bank of Greece in 1921, $114,010,259 was received through immigrant remittances, most of them from Greeks living in the United States.

Of course, some Greeks did return to the homeland, especially in periods of economic depression in America: according to the Annual Report of the Commissioner General of Immigration, 197,088 Greeks had returned to Greece between 1908 and 1931. However, for many Greek immigrants the prospect of returning to their family and home country with pockets full of new wealth soon turned out to be untenable. Realizing that their stay in the country was being indefinitely prolonged, they started organizing themselves around a society of Greek character and structure that would help them preserve their Greek identity. One of their first steps was the establishment of Greek Orthodox churches that were initially ministered by priests sent from home. The first Greek Orthodox congregation was formed in New Orleans, Louisiana. Several churches and communities centred around them were established in the following years, while Greek newspapers soon made their appearance with a double aim: to create a bridge to English-speaking society for the mostly Greek-speaking immigrants and to keep them updated with events in the homeland. *Neos Kosmos* started up in Boston in 1892 but closed after only eight years. *Atlantis* was founded in New York City in 1894 and lasted until the mid-1970s. *Ethnikos Kiryx* appeared in New York City in 1910 and has been in circulation ever since.

However, these communities did not always conduct their affairs harmoniously. Intragroup differences would often plague them, frequently kindled by similar divisions in the home country. That was the case with the friction around Eleftherios Venizelos and the loyalists in Greece, especially during the 1910s, which brought severe conflict to the Greeks in America and thus encouraged anti-Greek sentiments amongst the American press and public who were dismayed at this divisive behaviour. Even the churches were for a long time at the centre of a fierce controversy over their jurisdiction, into which the Holy Synod of Greece and the Ecumenical Patriarchate were both drawn, and which formally ended in 1930–31 when the Archdiocese of North and South America was definitively attached to the Patriarchate. The new archbishop of North and South America, Athenagoras, then started his long tenure during which he worked persistently and efficiently towards uniting the Greek communities in the United States.

The wake of the defeat of the Greeks in Asia Minor in 1922 saw the onset of a gradual withdrawal of the concern of the American Greeks for affairs in the homeland. Disillusioned with the vices tormenting Greek political and economic life and accepting the indefinite nature of their stay in America,

they started to feel a need for further integration into and for a deeper commitment to their new homeland. The Greek entrepreneurial spirit had already worked miracles throughout America and many Greeks were known to own small and successful business in the places where they started as cheap labourers. In September 1922 AHEPA (the American Hellenic Educational Progressive Association) was formed in Atlanta, Georgia, with the explicit aim of uniting the Greek communities and promoting Americanism among the Greeks of the United States.

World War II had a significant effect on the Greek communities in the United States. The heroic resistance of Greece against the Axis powers attracted attention and much admiration in the United States, also filling the Greek Americans with a renewed sense of pride in their homeland and a renewed concern for its plight. The Greek War-Relief Association was founded less than a fortnight after Greece was invaded, and within a few months it was reported that $5,250,000 had been collected. In February 1943 the Friends of Greece announced a plan to finance the reconstruction of Greek cities and towns, with blueprints to be drawn up at the School of Architecture of Columbia University. Additionally, throughout the war, numerous organizations fundraised continually towards shipping foods, medicine, and clothing to Greek war victims. In the aftermath of the war these Greek-Americans' support for Greece was reflected in the favourable terms of the Marshal Plan, while their pressure was instrumental in the decision for the return of the Dodecanese islands to Greece in 1947.

In the years after the war new waves of emigrants departed for America. This immigration pattern involved well-educated people, many of whom are now enjoying highly respectable positions in American society. Lobby groups have been created in Washington, promoting in Congress the concern of Greek-Americans for issues related to their mother country; notable among them are the United Hellenic Congress and the American Hellenic Institute. These and other lobbying groups staged substantial opposition to the 1967 dictatorship in Greece and the Turkish invasion of Cyprus in 1974, enlisting important academic and professional people in their campaigns.

Nowadays, Americans of Greek descent for the most part enjoy an integrated position in American society, with many of them retaining a keen interest in the affairs of Greece. Several Greek-Americans have held influential political positions, notably Spyro Agnew, John Brademas, Paul Sarbanis, and Michael Doukakis. Greek- Americans as a whole enjoy professional success: it is estimated that their income falls only 4 per cent below the average for the total American population. The latest immigration wave from the late 1960s onwards has established the new type of Greek-born university-educated student immigrants, who have subsequently moved on to occupy respectable positions in American academia.

Varnalis, Kostas 1884–1974

Poet, prose writer, and critic

Kostas Varnalis's work – more than the work of his contemporaries Angelos Sikelianos and Nikos Kazantzakis – could be read as a striking paradigm of "the anxiety of influence", with the persona of blind Oedipus in his poem *Proskynitis* ("Pilgrim", 1919) functioning as an emblem of this anxiety. His most important texts constitute a disciplined distortion of powerful precursors such as Aeschylus, Plato, Xenophon, Aristophanes, Solomos, Rabelais, Goethe, and Flaubert, in the name of a truth they failed to discover. The historical and ideological conditions at the end of the 20th century encourage an evaluation of Varnalis as a poet who was defeated in his struggle to assert himself against his renowned precursors. Furthermore, literary ideologies that dismiss traditional poetics or the ideals of human emancipation and solidarity as tedious anachronisms classify Varnalis as an overvalued writer, while ideologies that resist the modernist and postmodernist "prejudices" consider him as either a twilight hero or a pioneering figure. Irrespective of the validity of such value judgements, the relationship of his oeuvre with the ancient Greek tradition and the poetics of the demoticist school remains a significant and appealing issue in the history of modern Greek letters.

Varnalis's work is usually separated schematically into two periods: the first (1902–19) includes all the poems he wrote before he embraced dialectical materialism, and the second (1922–74) his lyrical and satirical texts written from a revolutionary, demystifying perspective. His long idealistic poem *Proskynitis* does not belong to either period because of its transitional character.

After the Graeco-Turkish War of 1897, the relative uniformity of the demoticist attitude towards antiquity broke down. The older generation of demoticists headed by Kostis Palamas continued to regard the ancient past as a reviving symbol which was to serve the present. For the younger demoticists however, and among them Varnalis, ancient tradition in their early poetry was to function as an "independent", autonomous symbol of beauty and vitality, apparently devoid of any social and political preoccupations. Contrary to established literary practice at that time, they adapted the Parnassian and Nietzschean readings of antiquity to their own aspirations in order to deliver Greek poetry from any social and political associations, from long-winded lyricism and ornate language. Whereas in Palamas's mature work Parnassianism and Nietzscheanism served the modern Greek search for a historical and cultural self-identity, in Varnalis's early poetry these were related to the attainment of beauty and the celebration of the Dionysian spirit.

The centrality of the category of the beautiful, the perception of art as the supreme value in life, the cult of instincts, the liberation of poetic language from the bonds of conventional morality, the lack of any nationalistic mystique, all constitute dominant features of the Varnalian use of ancient tradition up to 1919. It was mainly because of his "unpoetic" language and coarse realistic imagery that he was acclaimed by many critics of his time as the initiator of new and unconventional elements in Greek poetry and a champion of the so-called "poetic revolution of 1910".

The period of painfully wrought, impeccable sonnets came to an end when Varnalis went to Paris in 1919. There, in an extraordinary atmosphere of ideological and literary effervescence, the need for a renewal of his poetic practice became self-evident. At this crucial point, the national literary tradition performed an important role in the transition from the aesthetic/hedonistic Hellenism of his first period to the idealistic Hellenism of *Proskynitis*. It was in the light of the Parisian experience that Varnalis decided to follow Dionysios Solomos's example and become a national bard. In *Proskynitis*, for the first time, an interest in the national collective psyche enters the domain of his poetic practice. The ideological representation of Hellenism as the incarnation of "the human Essence" is central to the poem. Thematic subdivisions devoted to the Homeric world, the cult of Dionysus, the folk songs, Cretan poetry, and Solomos stress the continuity and "eternal greatness" of the Hellenic historical-cultural tradition. Nevertheless, this embellished and idealized picture of the Greek nation is undermined by the anticlimactic epilogue where the tension between the real and the ideal appears unresolved.

Varnalis's idealism achieved its full embodiment in *Proskynitis*, but the poem already adumbrates an opposite standpoint. *To Phos pou Kaiei* ("The Burning Light", 1922), *Sklavoi Poliorkimenoi* ("Enslaved Besieged", 1927), and *I Alithini Apologia tou Sokrati* ("The True Apology of Socrates", 1931) are the three major works of his artistic maturity. They all oscillate between bitter scepticism about the human condition and the expectation of a classless society as a

historical imperative. *Sklavoi Poliorkimenoi* – a refutation in verse of Solomos's *Elevtheroi Poliorkimenoi* ("Free Besieged") – is the only one which does not draw on symbols from antiquity. The demystification of war, religion, and Solomos's idealist notion of freedom is effected through the radical reappropriation of Christian myth and folk tradition.

To Phos pou Kaiei is a symbolic dramatic composition in the manner of Goethe's *Faust* and Flaubert's *La Tentation de Saint Antoine*. The assimilation of traditional material from the standpoint of internationalism and class humanism is achieved through the dialectical tripartite organization of the work, the reinterpretation of mythological archetypes as familiar human figures, and the intensity of satirical unmasking. The symbols of Prometheus and Jesus were used to point out the deficiencies of Hellenic and Christian thought, while ancient sources (Hesiod, Aeschylus, Aristophanes, Nicander, Lucian) were treated in such a way as to present a demystified antiquity. The poetics of unmasking reached its culmination with *I Alithini Apologia tou Sokrati*, one of the three major satirical texts of modern Greek literature, the other two being Solomos's *I Ginaika tis Zakynthou* ("The Woman of Zakynthos") and Emmanouil Roidis's *I Papissa Ioanna* ("Pope Joan"). The tension and synthesis between the ancient and the modern, the radical and the regressive, the realistic and the symbolic, satire and lyricism, emerge as the ideological and formal principle of the work. The Varnalian Socrates, functioning simultaneously as an apostle of idealism and a social rebel, an advocate of social discriminations and a prophet of the classless society, a sensitive lover of nature and a relentless critic of the Athenian polis, reenacts and defies in a Rabelaisian fashion the Socrates of Plato, Xenophon, and Aristophanes.

This highly dialectical combination of antitheses based on ambivalence is absent in Varnalis's two postwar prose works, *To Imerologio tis Pinelopis* ("The Journal of Penelope", 1947) and *Attalos o Tritos* ("Attalus III", 1972). The first, a satirical demythologization of Penelope and the Homeric world, does not achieve the balanced combination of symbolism and satire found in *Alithini Apologia*. The second, the poet's sole play, reveals the network of power relationships in Hellenistic Pergamum as similar to that in postwar Greece, but is lacking in ambivalence and suggestiveness.

With the exception of *Proskynitis*, the relation of Varnalis's oeuvre to the Hellenic tradition never entailed a notion of Greece as a hypostasized essence. During the poet's first creative period Hellenism was a source of symbols and metaphors for the celebration of aesthetic life. From 1922 onwards its artistic assimilation subserved a twofold objective: to unmask and censure the dominant readings of past and present alike. The Varnalian use of tradition, far from constructing an ahistorical concept of "Greekness", exposes the recurrence of relations of power and exploitation in different forms. And in doing so, it indirectly demonstrates intertextuality as a poetic device, as a critical practice, as much as an inherent property of writing itself.

THEANO MICHAILIDOU

Biography

Born in Burgas in 1884, Varnalis studied classics at the University of Athens and was a militant member of the demoticist movement. In 1919 he won a state scholarship to study in Paris, where he attended courses on aesthetics and modern Greek literature. He worked as a teacher but was relieved of his post in 1926 on the grounds of being a communist. From then onwards he lived as a journalist and translator. The inter-war years were the most creative period of his life. In 1959 he was awarded the Lenin Prize for peace. He died in Athens in 1974.

Velestinlis, Rigas *c.*1757–1798

Revolutionary and martyr

Rigas (as he is usually known) was born at Velestino, ancient Pherae (hence his cognomen Velestinlis or Pheraios) about 1757. According to one tradition his father was a rich landowner and Rigas was educated in Thessaly and worked for some time as a schoolmaster. To improve his financial situation he went to Constantinople and from there to Bucharest, the capital of Wallachia, which was governed by Greek Phanariots under the dominion of the sultans. Rigas had close relations with some of these Phanariot princes and also with representatives of the incipient Greek Enlightenment. He acquired a large holding of land and cattle. In 1788 he joined the service of the Baron de Langenfeld, whom he accompanied to Vienna in 1790. In the Austrian capital he published three books as an essential contribution to the enlightenment of his people: (1) *Scholeion ton Delikaton Eraston* ("The School for Discerning Lovers": six love stories from the collection of the French author Nicolas Edmonde Rétif de la Bretonne, 1734–1806, as an example of "modern" European literature and of the new relations between the sexes); (2) *Physikis Apanthisma* ("Physics Anthology": an introduction to physics on the basis of European works, to stimulate the legacy of Plato and Aristotle); (3) a translation of *L'Esprit des lois* by Charles de Montesquieu.

In 1791 Rigas returned to Bucharest in order to administer his property and to continue his activity as a translator and writer. He made contact with French revolutionaries residing in Wallachia, especially the diplomat Émile Gaudin; from these friends Rigas obtained the latest news and literature about the French Revolution. Rigas developed the idea of a national and social uprising of the Greek people, and although it is not certain, it is possible that he founded a secret society. In 1796 he returned to Vienna, which was also a centre of the Greek intelligentsia and offered him the opportunity for political agitation in Austria and neighbouring countries. At the start of 1796 the *Thourios Ymnos* ("War Hymn") was published; it

Rigas Velestinlis

analysed the political and military situation of the time and called for an insurrection not only of the Greeks, but of all the peoples of the Balkans, including the Turks. In 1797 the Viennese publishing house of the brothers George and Poulios Pouliou printed the following works by Rigas: (1) *O Ithikos Tripous* ("The Ethical Trilogy"), a collection of three belletrist works of the European Enlightenment, translated into Greek: the drama *Olympia* by the versatile Italian Pietro Antonio Metastasio (Rome 1698, Vienna 1782), the novelette by the member of the Paris Academy and favourite of Voltaire, Jean François Marmontel (1723–99), *La Bergère des Alpes*, and the idyll *Der erste Schäfer* by the Swiss poet and painter Salomon Gessner (1730–88); (2) *To Taxidion tou Neou Anacharsidos, IV*, a translation of part of the fourth volume of the famous work *Voyage du jeune Anacharsis en Grèce*, a kind of *Kulturgeschichte* of Classical Greece, published by the French antiquary Jean Jacques Barthélemy (1760–95) in 1788; for Rigas it was an aid to the formation of the national consciousness of his people; (3) *Megali Charta tis Ellados* ("Great Map of Greece"), a geographical map of the territories with Greek settlements: Greece and the Aegean, Asia Minor, southeast Europe; many placenames are given in ancient and modern Greek forms; important historic places have special illustrations in the margin; (4) *Geniki Charta tis Moldavias* ("General Map of Moldavia"); (5) *Nea Charta tis Vlachias* ("New Map of Vlachia"); (6) *Eikon tou Megalou Alexandrou* ("Likeness of Alexander the Great"), with marginal sketches illustrating the life of Alexander and an explanatory text in modern Greek and in French; (7) *Enkolpion Stratiotikon* ("Military Handbook"), a translated extract from the writings of the Austrian field marshal Count Ludwig Andreas Khevenmüller (1683–1744), as a help in the preparation of the armed insurrection (no copy of this work has survived); (8) *Epanastatiki Prokiryxis* ("Revolutionary Manifesto"); the original text has not survived, but it can be reconstructed in its four parts: the *Nea Politiki Dioikisis* ("Modern Civil Government") provides an introduction to Rigas's political programme, which applies to all regions where Greeks are living together with "non-Christians", i.e. Turks; the second part contains 35 articles on human rights according to the French *Déclaration des droits de l'homme*, but adapted to the Greek situation; there follows a plan for a constitution of this region in which several peoples are to be found but the Greeks are dominant; the last part repeats the *Thourios Ymnos*, a kind of poetic interpretation of the constitution. Separately Rigas published two other political poems, the *Ymnos Patriotikos* ("Patriotic Hymn") and the *Paian i Ethnikos Ymnos* ("Paean or National Hymn").

On 17 October 1797 France and Austria concluded the Treaty of Campoformio. This treaty ceded the Venetian possessions in Albania and in the Ionian islands to Napoleon. The changed political situation seemed to Rigas to be the right moment for the insurrection. He wrote a letter to Napoleon (which was confiscated by the Austrian police) and without waiting for an answer he went to Trieste with his revolutionary material in order to travel to Greece. But he was betrayed and arrested by the Austrian police. He was taken to Vienna and from Vienna to Belgrade in the spring of 1798. Here he was strangled by the Turks on 28 June 1798 together with seven comrades.

Rigas was one of the most eminent representatives of the Greek Enlightenment and the most important forerunner of the Greek uprising of 1821. His poems were very popular and he himself became a martyr not only in Greece but throughout the Balkans. His politics were geared to the liberation of all Balkan peoples and to the formation of a Balkan state under Greek hegemony. But in the wave of Greek nationalism after 1821 his intentions were misunderstood. The Patriarchate of Constantinople condemned his actions and Greek chauvinism later falsely made him into a precursor of the *Megali Idea* ("Great Idea") of the reconstruction of the Byzantine empire. His unfettered patriotism was based on the memory of Greek antiquity and influenced by the ideas of the European Enlightenment and the French Revolution.

Biography

Born at Velestino (ancient Pherae in Thessaly, whence his alternative name Pheraios) *c.*1757, Rigas was educated in Thessaly and worked for a while as a schoolmaster. He moved first to Constantinople and then to Bucharest where he befriended the Phanariots and representatives of the Enlightenment. Inspired by the French Revolution with ideas for Balkan liberation he published revolutionary tracts for which he was arrested in Trieste. Strangled to death by the Turks in Belgrade in 1798, he became a martyr throughout the Balkans.

Velouchiotis, Ares 1905–1945

World War II resistance leader

Ares Velouchiotis was the nom de guerre of Thanasis Klaras, leader of ELAS (*Ellinikos Laikos Apeleftherotikos Stratos*, or the Greek Popular Liberation Army) which spearheaded the resistance to the German and Italian occupation forces during World War II and later became the military wing of the Communist Party in the Civil War against the combined Greek and British royalist forces. Velouchiotis's life has been obscured by countless layers of ideologically driven calumny from both the left and the right in Greece. He has been variously portrayed as a self-serving renegade, a merciless terrorist, or communist pawn. To many, however, he remains a shining example of patriotism and idealism during one of the country's darkest hours. He led one of the most effective resistance movements in all occupied Europe and his military prowess was legendary.

Born in Lamia to a middle-class family, Klaras demonstrated from a young age a nonconformism and iconoclasm that would mark his entire adult life and would eventually lead to his death. Although undoubtedly intelligent, he was refused entry into high school because of his ungovernable temperament. Since he was unwilling to follow in the footsteps of his father and older brother, who were both lawyers, his family arranged for him to be trained as an agronomist. After a brief tenure in the Ministry of Agriculture, Klaras left for Athens where he sought the company of like-minded young idealists who had grown impatient with the rising poverty of the masses and the government's authoritarian methods. This led him to join the motley coalition of leftists who then made up the emergent Communist Party of Greece. He became a member and served the party in a wide variety of functions, including journalist, courier, and political agitator. On one notable occasion he risked his life to save that of the party's leader, Nikos Zachariadis, who, ironically, was to betray him years later in the name of party discipline. Unrepentantly irreverent, Klaras smoked, drank, and sang popular songs, refusing to toe the party's puritanical line that forbade most forms of entertainment as degenerate. Klaras was jailed repeatedly for his political activities and suffered torture at the hands of the state security services until, in 1939, disillusioned with the party's inflexibility on the issue of signed renunciations of communist ideology, he won his release from prison by signing such a declaration. His membership in the party was revoked and he was ostracized by his former comrades, many of whom had always viewed his boldness and nerve with suspicion. After his release from prison he became isolated and dejected, eventually taking to drink, until the declaration of war in October 1940.

With the onset of the German-led occupation in 1941, Klaras began secretly organizing resistance. A gifted orator, he made speeches in which he invoked the heroic achievements of the revolution of 1821 against the Turks. He held that the key to effective resistance was armed struggle in the mountains, the traditional haven of the Greek klephts, the rebels who had won independence for the nation by fighting a war of attrition against the Turks. In a bid to remove this agitator from their midst, the Communist Party sent him to central Greece with the mission of exploring the possibilities for armed resistance. Slowly at first and against great difficulties, Klaras, now known as Ares Velouchiotis (a name derived from his ancestral village of Velouchi), began recruiting men from villages across the mainland. Velouchiotis's manner quickly won over the rural population and his resistance force gradually grew. His partisans struck at the Italian and German occupiers with swiftness and daring, often defeating numerically superior forces with great displays of courage and audacity. In November 1942 Velouchiotis's men, together with a smaller force from the rival resistance organization EDES (*Ethnikos Dimokratikos Ellinikos Syndesmos*, the National Democratic Hellenic Union) and a small detachment of British commandos, blew up the Gorgopotamos rail bridge. The most important European sabotage operation up to then, the destruction of the bridge cut off the principal supply line to Rommel's forces in North Africa for nearly five weeks, thus giving the British Eighth Army the upper hand in what became the first Allied victory, at El-Alamein.

Under Velouchiotis's leadership ELAS grew into a formidable, agile, and uniquely effective resistance movement with a broad popular base. By the spring of 1943 they had liberated nearly a third of Greece, from Kastoria to the Corinthian Gulf. Velouchiotis's guerrilla tactics had forced the Germans and Italians to withdraw to a handful of small cities. His success was viewed with amazement and suspicion by the political classes of Athens and by the British who cooperated with him nominally while financing independent, right-wing resistance forces in an effort to ensure Greece became a pro-British monarchy after the war. He in turn was deeply suspicious of politicians and openly hostile to most foreigners, especially the British, whose political intentions he rightly mistrusted. Velouchiotis showed brazen disregard for party policies, a fact often overlooked by critics who accuse him of having blindly served the communist cause. He cared little for ideology and was noted for invoking the glorious achievements of the ancient and 19th-century Greeks rather than the militant ideas of Marx or Lenin. His success as a partisan leader among the mountain villagers of Greece can be partly attributed to his profound respect for rural customs and the often harsh discipline he imposed on his men. Although he had no military training, he was a peerless tactician and charismatic leader who earned the loyalty of his men through humility and fairness. Demotic songs composed in his honour still survive.

Velouchiotis nevertheless made many enemies, especially among those on both the left and the right who saw their own political prospects in postwar Greece threatened by his popu-

larity and military might. The communists began a secret smear campaign against him in the cities, implicitly supporting the accusations of theft and savagery levelled by rival right-wing partisan groups. On a number of occasions Velouchiotis's men came into open conflict with right-wing partisans supported by the British. These conflicts foreshadowed the Civil War that followed the liberation of Greece and resulted in the transformation of Velouchiotis's resistance force into an armed wing of the Communist Party. Velouchiotis did not live to see this. He broke ranks with the party over the controversial agreement with the British-backed Royalists, signed at Varkiza in the winter of 1944. Accompanied hy a core group of his most loyal fighters, he went into hiding in the mountains of central Greece, pursued by right-wing militias. Driven to despair over the country's political situation and his own increasing isolation, Velouchiotis took his own life on 16 June 1945 near the Acheloos river. His head was cut off by right-wing militiamen and set on display in the town of Trikkala as proof of his death. His memory remains a source of vociferous political debate and attempts to recognize his decisive role in the liberation of Greece continue to provoke contention.

Venetians

The region at the head of the Adriatic – Venetia and Istria – formed one of the imperial provinces. In the early Byzantine period, as the barbarian invaders moved into Italy, the islands of the Venetian lagoon were settled by refugees. The newcomers retained their imperial links: their dukes or doges had portentous Byzantine titles, frequent embassies passed between Venice and Constantinople, and Venetian chroniclers concerned themselves with events in Byzantium. Venetian churches were dedicated to Greek saints and were enriched with Greek relics, such as those of St Sabas, St Donatus, and St Nicholas of Myra, some received as gifts, others filched by raiding parties. The church of St Mark in Venice, which served as the palatine chapel of the doge, was adorned with a succession of rich altarpieces made up of pieces of Constantinopolitan workmanship reaching their final form in the Pala d'Oro of the 14th century. The third rebuilding of St Mark's in the years 1063–94 was in conscious imitation of the church of the Holy Apostles in Constantinople. A set of doors made in Constantinople graced its portals. As for ecclesiastical traffic the other way, a Venetian chronicler claimed that Greek use of church bells began with a gift of bells from Venice. The coincidence of Venetian and Greek interests in opposing Dalmatian piracy and Saracen advances in the Adriatic strengthened the relationship, prefiguring the Venetian-Byzantine resistance to the Normans in the next two centuries. Venetian merchants became increasingly active in trade between Italy and the empire, importing even silk textiles, despite imperial prohibition, and competing with the Greeks for the carrying trade within the empire itself.

From 992 comes the first of a series of privileges that further mark the stages in the relationship between the empire and Venice. An imperial bull of that year established a favourable scale of tariffs for Venetian merchants and, by excluding them from the jurisdiction of certain officials, gave them an advantage from which their Amalfitan and other rivals were explicitly excluded. Almost a century later under the emperor Alexios I Komnenos (1081–1118), a bull, or perhaps a series of bulls, exempted the Venetians from payment of duties throughout the empire. The concession further made over to the Venetians a number of properties on the Golden Horn, which later became the Venetian quarter of Constantinople where the Venetians enjoyed rights of extraterritoriality. During the 12th century Venetian privileges were confirmed and extended. The survival of several hundred private Venetian commercial contracts shows how active the Venetians were in the empire at this time. They had their own churches, monasteries, domestic and commercial properties, not only in Constantinople but also elsewhere in the empire, for example at Corinth and Almyros. Olive oil is the commodity most often the subject of these contracts. By the second half of the 12th century the numbers of Venetians resident in Constantinople, said to be 10,000, inflamed anti-western feeling in the capital. In a famous passage Niketas Choniates refers to Venetian arrogance, to the affront caused by Venetian marriages into Greek families, and to the great temperamental gulf that divided the two peoples. The tension exploded in 1171 when the emperor Manuel ordered the arrest of all Venetians in the empire. The disruption of life in the empire must have been severe and this, perhaps combined with Venetian retaliation and their pact with the Normans, led Manuel to negotiate, but at his death in 1180 negotiations were still incomplete. Under the Angeloi emperors the old Venetian privileges were confirmed and more fully enumerated while their legal status was enhanced.

The Fourth Crusade of 1202–04 delivered Constantinople to the westerners. The story, perhaps not literally true, that the doge Enrico Dandolo had lost his sight in the struggle with the

Greeks in 1171 was at any rate expressive of the residue of bitterness against the Greeks that those events had produced in Venice. In the division of the spoils the Venetians took three-eighths of the city and the Balkan coast south of Dyrrachium. They obtained Crete by purchase from the Crusaders, and the Ionian Islands and others such as Euboea, Andros, Naxos, and Santorini fell to Venice or Venetian citizens in the course of the next century. The doge took the title of lord of a quarter and a half of a quarter of Romania, that is of the "Roman lands" or Byzantine empire. A Venetian *podestà*, or governor, was appointed in Constantinople and rivalled the Latin emperor and the doge himself in influence. The monastery of the Pantokrator became his headquarters. It took years for the abundant loot to be transported to Venice. The plunder included antiquities such as the great bronze horses from the Hippodrome destined to adorn the loggia of St Mark's, church plate for the treasury of St Mark's, innumerable architectural trophies, some to adorn the exterior of St Mark's and some, like so many columns, to be sliced into roundels for the decoration of *palazzi*. Relics included the icon of the Hodegetria, said to be the work of St Luke, carried off to the Venetian Pantokrator, while others such as the head of John the Baptist, an arm of St George, the headless body of St Paul the hermit, and the body of St Eutychios ended up in Venice. Even the Crown of Thorns, initially appropriated by the Latin emperors, was pawned to a consortium of Venetian businessmen in 1238. Gleeful Venetian chroniclers catalogued the extent of the spoils while Niketas Choniates mournfully recorded the losses.

In 1261 the Greeks once more took Constantinople, with the help of Venice's great rival, Genoa. During the period between 1261 and 1381 there were four Venetian–Genoese wars, some of great intensity, which were often fought off the Byzantine coast or on Byzantine seas. Neither the restoration of Greek power in Constantinople nor the enmity of the Genoese inhibited the progress of Venetian commerce so much as might have been expected. In the 14th century Venice, like Genoa, made agreements with the Grand Komnenoi in Trebizond, modelled on the concessions in Constantinople, which gave them an enclave and commercial advantages. Throughout the Byzantine lands and through those lands to distant destinations beyond them, Venetian commercial enterprise continued to prosper. The two centuries between 1261 and the fall of Constantinople to the Ottomans in 1453 were dominated by conflicts in which the two Italian states, Byzantium, and the emerging Ottoman power were the leading protagonists in an intricate and changing set of alliances and counter-alliances, seldom made with regard to religion or to the interests of western Christendom as a whole. A series of short-term treaties between the Greek emperors and Venice gave the Venetians new quarters in Constantinople and Thessalonica, protection for their ecclesiastical usages, and their own weights and measures. These rights were extended to those of mixed parentage who classed themselves as Venetians. A commission was established to examine the many demands for compensation for losses that the Venetians claimed to have suffered in the empire. Concessions and agreements constantly broke down under the pressure of threats, squabbles over alleged infringements, and disputes over the regulation of corn sales or taxing wine. In 1343 the poverty of Byzantium compelled the empress Anna, regent for her son John V, to pawn the crown jewels to Venice to secure a loan of 30,000 ducats. Four years later, at the coronation of John VI, glass baubles had to be substituted, while Venice became restless at the failure to repay the interest. In the 1370s Venice seized the strategic island of Tenedos when negotiations to buy it from the emperor were stalled by dynastic disputes and Genoese subversion. After the Peace of Turin in 1381 ended the Venetian–Genoese wars, Venice was principally concerned with the protection of its trade and possessions in Greece from the rising Ottoman power. In 1453 some individual Venetians fought bravely against the Turks, hut the Venetian state made an alliance with the sultan. Venice had already written off Byzantium.

Under the Ottomans Venice struggled, not unsuccessfully, to retain some of its outposts and even to take new ones, such as Monemvasia. Crete remained Venetian until 1669 and the Ionian islands until the fall of the Venetian republic in 1797. The visible remains of the Venetian presence include loggias and fortifications in Crete and on the coast of the Peloponnese, such as Modon and Monemvasia, while Venetian architectural features appear in the churches of the Ionian islands and the Argolid. A scattered Roman Catholic population in some Aegean islands such as Naxos and Santorini is attributable to the Venetian presence.

In the early centuries a knowledge of Greek had been rare, almost unknown, in Venice, but even before 1453 Greeks had begun to arrive in the city. Famous scholars included Demetrios Kydones and Bessarion, while the Cretan painter El Greco was numbered among the artists. Some 4000 Greeks were resident there before 1500. Bessarion made a gift of his library to Venice. For Aldus Manutius Venice was the best city for the foundation of his Greek press, although some may claim that his founts, based on the Greek script of the day with ligatures and accents, were less successful than the typeface of Nicolas Jenson who himself had worked in Venice. From 1573 the church of S. Giorgio dei Greci was the focus of the Greek community in Venice and became a centre for Hellenic studies.

Venetokratia 1204–1797

Venetokratia is the term given to the period of Venetian rule in the areas of Greek-speaking, formerly Byzantine-controlled territories. The period begins with the Fourth Crusade (1204) and closes essentially with the formal end of the Venetian Republic in 1797. Those Greek lands that were divided between Frankish and Venetian rule experienced over this period – some for a longer and others for a shorter length of time – foreign domination that varied in character. Some, for example, passed directly from Byzantine to Venetian rule, others became feudal fiefs according to the pattern of the medieval West, while yet others had to undergo a process of feudalization before finally becoming Venetian dominions. These differing historical circumstances affected the local populations of each region in various ways.

After the Latin conquest of Constantinople in 1204, Crusaders and Venetians divided among themselves the territories of the dismembered Byzantine empire. According to the terms of the agreement known as the *Partitio Terrarum Imperii Romaniae*, the Byzantine lands were divided into six lots, of unequal size, two of which were given to the Latin emperor, two to the Crusaders, and two to the Venetians. In reality, however, the *Partitio* was of little practical worth since the lands that were assigned to the Crusaders had not as yet been conquered.

One of the Greek lands that was to experience a long period of Venetian rule was Crete. The island is not mentioned in the *Partitio* because it had ceased to be part of the Byzantine state just prior to the Crusade. Among the terms of the agreement made between Alexios Angelos, son of Isaac II, and the Crusaders, whereby Alexios secured the Crusaders' support in his efforts to put his father back on the throne of Byzantium, was the cession of Crete to Boniface, marquis de Montferrat, the leader of the Fourth Crusade. Since the island already belonged to Boniface before the conquest of Constantinople, it was not mentioned in the *Partitio*.

A few months after the conquest of the Byzantine capital, however, on 12 August 1204, in his efforts to win the support of Venice in his dispute with the Latin emperor of Constantinople, Baldwin of Flanders, Boniface signed a treaty ceding Crete to the most Serene Republic of Venice. At first Venice was too involved with establishing control over its newly won Greek-speaking territories to push ahead with a full takeover of the island of Crete as well. Thus when Genoese pirates, led by Enrico Pescatore, titular count of Malta, attempted to seize the island, they succeeded in taking control of it relatively quickly. Venice reacted immediately by sending its fleet to Candia. Pescatore was eventually compelled in 1211 to come to terms with Venice, though he was not sent away empty-handed. The withdrawal of the Genoese marked the beginning of Venetian rule in Crete, which was to last until 1669.

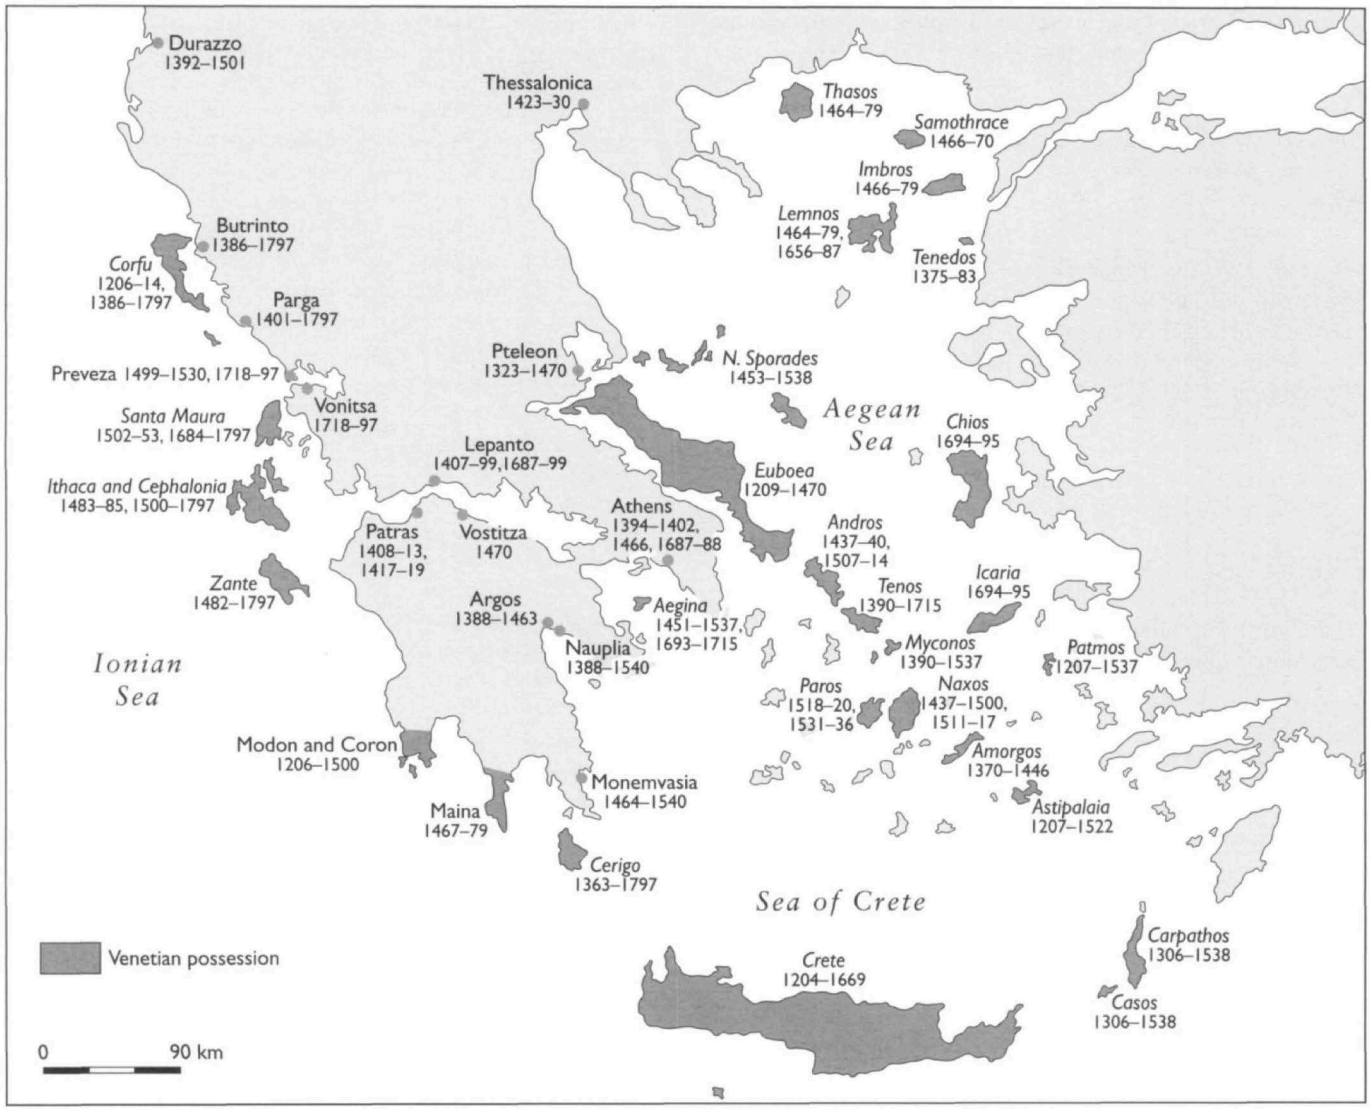
Another island that had been prised from Byzantine control on the eve of the Fourth Crusade was Cyprus. The island had originally been conquered in 1191 by king Richard the Lionheart of England, one of the leaders of the Third Crusade, who subsequently gave his dominion first to the military Order of the Temple, and then to Guy de Lusignan, king of Jerusalem. The French Lusignan dynasty was to remain in Cyprus for the next 300 years. The marriage of Giacomo II (1460–73) to Caterina Cornaro, the daughter of a noble Venetian family, signalled the beginning of Venetian mercantile domination of the island. Venice meanwhile prepared the ground for outright control of the island and in 1489, after the death of Giacomo, compelled Caterina, now queen regent of Cyprus, to resign her right to sovereignty of the island and to hand it over to Venice. The Venetian period in Cyprus lasted until 1571, when the island was conquered by the Turks.

Thessalonica also experienced a short period of Venetian rule. In 1423 the despot Andronikos Palaiologos found himself unable to defend the city against the Turkish threat and consequently ceded control of it, with the approval of the Byzantine emperor and the local population, to the Venetians. Ever with an eye to its commercial interests, Venice snatched up the offer and rushed to take over the city. Venetian control lasted until 1430, when the Turks captured it.

Athens was initially conquered by the French and ruled by the la Roche Burgundians. Later, however, it came under the control of the Catalans and then the Florentines, before succumbing to the Turks in 1456. Two centuries later Athens experienced further misfortune. In 1687, in their efforts to contain the Turkish military threat, the forces of the Venetian Francesco Morosini and of the Swede Königsmarck decided to invade and take control of Attica. During the course of the siege of the Acropolis by the Venetians, explosives fell on the Parthenon, which the Turks were using as a magazine, and the Classical monument was severely damaged by the enormous explosion that resulted. Despite initial successes, Morosini was eventually forced to abandon his siege of the city, taking a number of important Classical sculptures back to Venice with him as a consolation prize.

The Venetian period in the Peloponnese can be divided into two phases: the first extends from 1204 to 1540, and the second from 1685 to 1715. During the first period the Venetian territories consisted of Modon and Coron (1206), Nauplia (1388), Argos (1388), and Monemvasia (1464). During the course of the second and third Turko-Venetian wars (1499–1502, 1572–73) Venice lost its dominions in the Peloponnese, together with Lepanto (Naupactus), its sole dominion in mainland Greece. The Venetian flag was not raised again in the Peloponnese until the end of the 17th century when Venice joined the Holy League (*Sacra Lega*) and declared war on the Turks. The second period of Venetian rule in the Peloponnese was not to last long: in 1715 the Turks replied to the blow dealt them earlier by the Venetians by recapturing the entire peninsula.

After the Fourth Crusade, Euboea (Negroponte) was divided between Boniface, marquis de Montferrat, who took the central part, and Venice, which took the northern and southern ends – Oreos and Carystus – of the long island. A little later Boniface gave his share to three nobles from Verona, who came to be known as the *terzieri* since they each took a



45. Venetian possessions in the Greek world

third. In 1390, following the death of the Latin feudal lord Giorgio Ghisi, the Venetians annexed the entire island. With the first Turko-Venetian war, however, the island fell under Ottoman control in 1470.

The Ionian islands were only gradually absorbed into the overseas dominions of Venice. Corfu was granted to Venice during the first period of Venetian rule, being placed under the control of ten Venetian nobles. This regime, however, lasted for less than ten years (1206–14) after which the island passed first to the Despotate of Epirus and then to the Angevins. Later, in the 14th century, the local population consented to being brought under Venetian rule, and were granted various privileges by the Serenissima. Venetian administration on the island survived to the end of the Venetian Republic in 1797. Zante became a Venetian dominion in 1482, and Cephalonia and Ithaca in 1500, while Leucas (Santa Maura) came under Venetian rule much later, in letter in 1684 and in practice in 1699, with the treaty of Karlovich. With the annexation of Leucas Venice also acquired Vonitsa and Preveza. Lastly, Cythera became Venetian in 1363, when Venice declared its virtual rulers – the members of the Venier family – personae non gratae because of their involvement in the St Titius rebellion in Crete. The two smaller islands of Paxos and Anticythera followed the fortunes of neighbouring Corfu and Cythera respectively. It was under the flag of St Mark that, for the first time in their troubled history, the Ionian islands acquired a specific political and geographical identity, when the whole group was treated as a clearly defined entity. The Venetian state, as early as the 14th century and long before gaining formal control of the Ionian islands, "desired", as a Venetian chronicler succinctly put it, "to acquire the configuration of islands comprised of Corfu, Zante, and Cephalonia". This "configuration" later comprised the principal feature of the Venetian presence in the Ionian Sea.

The Aegean islands, with their capital on Naxos, comprised the duchy of the "Arcipelago", and were divided into feudal domains governed as family fiefs by Venetian nobility, some for longer, others for shorter periods of time. Often the names of the families came to be linked with the local history of the various islands, such as the Sanudi in Naxos, Paros, Antiparos, Melos, Ios, Kythnos, and Siphnos; the Dandoli in Andros; the Querini in Astypalaia; the Barozzi in Santorini; and the

Cornari in Karpathos. The decline in power of the various Latin fiefdoms began in 1537 when Barbarossa crushed the strength of many of the Latin dynasties in the Aegean. The consolidation of Turkish power throughout the Aegean, however, was not effected until 30 years later, in 1566.

In the first centuries of Venetian rule in Greek lands the elements of the distinctly foreign culture established themselves only very slowly, faced as they were by a tightly knit Greek social body, and succeeded in influencing only a limited number of areas of local life. Nevertheless Hellenism, presented as it was with an open road of communication with the West, came under the influence of the European Renaissance and began to assimilate the values of the Western world. With the gradual meeting of these two worlds, over time relations between what had originally been mutually hostile communities became warmer. Greek society not only assimilated foreign influences but also blended older and newer cultural traditions. The fusion of the foreign with the Greek reached its quintessence perhaps in Crete, where a fertile cultural dialogue between the Byzantine tradition and western Europe gradually led to a common, Veneto-Cretan form of cultural expression, particularly in painting and literature. Despite the unpleasant aspects of foreign occupation, and despite the unusual blend of conditions under which the Greeks lived throughout the course of Venetian rule, they nevertheless managed to maintain their own cultural character and potential and to make of this a new, exciting fabric.

Summary

Dating from the Fourth Crusade in 1204 to the end of the Venetian Republic in 1797, *Venetokratia* denotes Venetian rule in former Byzantine territory. The principal areas were Crete (1204–1669); Cyprus (1489–1571); Thessalonica (1423–30); the Peloponnese (1204–1540 and 1685–1715); Euboea (1390–1470); the Ionian islands (various dates from 1206 to 1797); and the Aegean islands (various dates from the 13th to the 16th centuries). The two cultures merged to form a generally harmonious and often creative blend.

Venice

Of all the maritime cities of Italy it was Venice that had the greatest impact on the fortunes of the Byzantine and modern Greek world. Itself a creation of Byzantium, it developed into a major economic power, rising from the status of a Byzantine province to be the ruling master of formerly Byzantine territories. With the reconquest of Italy by the Byzantine emperor Justinian in the 6th century, Venice became a part of the Byzantine empire. The governor of the *provincia Venetiarum* was the *magister militum*, later *dux*, who was under the direct authority of the exarch of Ravenna. A fine example of the Byzantine presence in the lagoon of Venice in this period is the inscription, dated 639, in the cathedral of Torcello, in which mention is made of the emperor Herakleios, the exarch Isaacius, and the *magister militum* Mauricius.

Venice: San Giorgio dei Greci and its 16th-century leaning bell tower

The fall of the exarchate of Ravenna in the mid-8th century marked the beginning of Venetian autonomy. However, the theoretical bond of vassalage that continued to unite Venice with Byzantium in fact served its interests. Thus the dukes, or *doges*, of Venice continued in this early period to use such titles as consul, *spatharius*, *protospatharius*, patrician, and *protosebastus*, awarded them by the Byzantine emperor. From the 10th century onwards the power and prestige of Venice increased. Following a request by the doge, the Byzantine emperors Basil II and Constantine VIII issued a *chrysobull* in 992 granting Venetian merchants tax exemptions in exchange for transporting Byzantine troops to Italy in Venetian vessels. This *chrysobull* was the first in a series of imperial documents

defining relations between Byzantium and Venice. Political and commercial relations between Byzantium and the maritime power resulted ultimately in the penetration of Venice into the sphere of Byzantine influence. Byzantine saints were worshipped, their relics were brought to Venice, doges were wedded to the daughters of Byzantine nobles, and Byzantine artistic styles were adopted or imitated. The earliest mosaics in the basilica of St Mark, whose architectural plans were based on the church of the Holy Apostles in Constantinople, together with the mosaics in the cathedral of Torcello, are among the finest examples of Byzantine art in the region of the lagoon.

In 1082 the emperor Alexios I Komnenos was hard pressed by the Norman invasions of Byzantine territories in the Balkans. In order to deal with the threat he sought the help of Venice, in exchange for which he granted the city far-reaching privileges that allowed Venetian merchants free access to all Byzantine ports. These served to open the way for Venetian expansion into the lucrative trade of the Levant. It has often been claimed that the seed of the Fourth Crusade that was to take place in 1204 was in fact planted with the *chrysobull* of 1082. In the words of Fernand Braudel, as termites eat away at the structure of a building invisible to the outside observer, so too Venice managed gradually to consume the vast Byzantine edifice. In 1204 the Venetians, with the help of the Crusaders, conquered the city of Constantinople and became masters of the lands of the dismantled Byzantine state. For a large part of the Greek world the period of Venetian rule had begun, to last in some areas for many centuries.

After the final fall of Constantinople to the Turks in 1453, Venice became a great cultural centre for the subjugated Greek world. In 1498 the Greeks of Venice, merchants, craftsmen, sailors, and soldiers (*stradioti*) set up the Greek Orthodox Contraternity of Venice, which was to be the most renowned of all the Greek confraternities of the diaspora. The Orthodox church of San Giorgio dei Greci, built in the years 1539–73, was decorated with beautiful works of art. Later, some of the greatest figures in the world of modern Greek learning were to study and teach at the college set up thanks to funding from Thomas Flanghinis in 1665. The Greeks of Venice maintained a hospital and a convent, and provided major bequests for schools in the Turkish-ruled Greek east (such as in Patras, Athens, and Ioannina). Numerous Greek books were printed in the Greek printing houses of Venice, and were then sent for sale and distribution in the Orthodox centres of the East. Besides the printing houses, Venice also played host to numerous scribes and copyists of manuscripts, editors and correctors of ancient texts, and painters and artists who contributed not only to the development of Greek cultural styles and values but also, more generally, to European culture and learning. Such figures included Ianos Laskaris, Markos Moussouros, and Domenikos Theotokopoulos, known as El Greco.

Summary

Venice became part of the Byzantine empire with the conquests of Justinian in the 6th century. It became autonomous after the fall of Ravenna in the mid-8th century. Its merchants were first granted tax concessions by the Byzantine emperor in 992 and further privileges in 1081. Venetian rule of much of the Greek world began with the Fourth Crusade in 1204. After the fall of Constantinople in 1453 expatriates made Venice a centre of Greek culture and learning.

Venizelos, Eleftherios 1864–1936

Politician

Eleutherios Venizelos was eight times prime minister of Greece. His legacy is a mixed one. An advocate of *enosis* (union) of the unredeemed Greeks with Greece, in the aftermath of World War I he came closer than any other Greek leader to achieving the *Megali Idea* (Great Idea). When this new empire was subsequently lost after his fall from power, Greece again turned to him to salvage what could be saved from the ruins. One of his last achievements was to inaugurate an unusually long period of Graeco-Turkish amity. Domestically he was a reformer, modernizing the government services and constitution, but his disputes with the king would begin the national schism which would dominate Greek political life for decades to come.

Venizelos was born on 23 August 1864 near Chania on the island of Crete to a Greek family which had migrated to Crete in the late 18th century. He graduated from the university in Athens in 1886 and returned to Crete to practise law. Venizelos became active in the political life of the island, was a leader of the local Liberal party, and a strong advocate of *enosis* of the Ottoman-ruled island with independent Greece. In 1888 he was elected to the Cretan assembly, but was forced to flee the following year after an unsuccessful insurrection against Ottoman rule. He was later allowed to return and was again elected to the assembly, becoming minister of justice. He was one of the leaders of a revolt against the Ottomans in 1897 and was one of the Cretan delegates sent to meet the admirals of the Great Powers dispatched to mediate a settlement. As a result of this mediation, Crete achieved autonomy within the Ottoman empire, under a high commissioner selected by the powers. The new high commissioner was prince George of Greece, son of king George I. Venizelos became head of the new island executive in 1899, but quarrelled with prince George, and they fell out by 1904. When Venizelos was defeated at the polls in 1905, he organized a revolt, proclaiming *enosis* with Greece. The revolt failed but it contributed to the departure of prince George and the appointment of a new high commissioner. During the years 1906–09 Venizelos served as either head of the Cretan government or leader of the opposition.

Venizelos's career was transformed as a consequence of the Goudi coup in Greece, which saw a significant faction within the army demanding reforms. Venizelos, who had become widely known because of his role in Cretan politics, was seen by many in metropolitan Greece as a politician who could implement reform, unsullied by close contact with the ruling elites of Athens. In 1909 king George invited Venizelos to Athens to advise him, in 1910 he was elected to parliament as a member for Athens, and then became prime minister, combining it with the war and naval portfolios. With tremendous energy, Venizelos set about modernizing the public services, including both the army and the navy. He also helped shape a new constitution, and in the elections of 1912 held under this new constitution he won a significant majority.

Venizelos displayed great shrewdness throughout his career in foreign policy. In 1912 he engineered Greece's role in the Balkan League, and in the Balkan Wars which followed (1912–13) he accomplished a significant expansion of territory for the Greek state, including *enosis* with his home island of Crete. Venizelos had worked well with king George, but the king was assassinated at the peak of Greece's victories, and his son and successor, Constantine I, did not enjoy as easy a relationship with Venizelos. The two fell out in particular over Greece's response to the outbreak of World War I in 1914. The entry of the Ottoman empire into the war on the side of the Central Powers led Venizelos to advocate support of the Allied cause, seeing an opportunity to acquire much of Greece's *irredenta* with Allied support. Throughout 1914–15 the king and Venizelos disagreed as to policy, the king advocating neutrality, Venizelos anxious to join the Allies. The dispute came to a head in 1915 over Greece's reaction to the Gallipoli campaign, with Venizelos advocating support for the Allies. The result was Venizelos's forced resignation. In the elections which followed, Venizelos's supporters won 190 out of 316 seats in parliament. This election can be seen as the beginning of the national schism which would bedevil Greek political life for decades to come, drawing sharp divisions through Greek life. Despite this commanding electoral victory, Constantine delayed as long as possible in appointing Venizelos as prime minister. Once this was done he reluctantly followed his prime minister's advice and allowed the Allies to land at Thessalonica (1 October 1915), which they wished to do in order to assist their beleaguered Serbian allies. The king still refused to countenance entering the war, backed by such figures as the chief of the general staff, General Metaxas. The king's unhappiness with Venizelos finally led to his dismissal. In the elections which followed, the Venizelists, who claimed the king's action to be unconstitutional, boycotted the elections and as a result a neutralist government was elected.

Venizelos now embarked on a dangerous course. At the end of September 1916 he and some supporters sailed for Crete, his original base of support. From there they sailed through the Aegean islands to Thessalonica, rallying support. On reaching Allied-occupied Thessalonica Venizelos proclaimed a Provisional Government of National Defence, which was quickly recognized by Britain and France, and which declared war on Germany and Bulgaria. king Constantine, who was rapidly losing support, left the country in June 1917, passing the throne to his son Alexander. Venizelos returned in triumph to Athens, and Greece as a whole now declared war on the Central Powers. Venizelos's acquisition of power with foreign support would turn many against him, and deepened national divisions.

Greece now reaped the benefit of Venizelos's earlier overhaul of the military. Venizelos was one of the great war ministers of the early 20th century, on a par with such figures as Britain's Lloyd George. Venizelos's energy saw the creation of a highly effective 11-division army, which performed with great effectiveness in the last offensive of the war. The collapse of both the Ottoman empire and Bulgaria in the autumn of 1918 opened the way for Venizelos to launch a diplomatic offensive to achieve the *Megali Idea*.

At the Paris peace conference summoned to settle the issues of World War I Venizelos, a consummate diplomat, emerged as one of the key figures, wielding influence out of all proportion to Greece's power. In the Treaties of Neuilly and Sèvres Greece acquired western Thrace and a substantial district around Smyrna in Asia Minor. Venizelos's fortunes now suffered a sudden reverse. The unexpected death of the young king Alexander, continued fighting in Asia Minor which necessitated continued mobilization, and the persistence of martial law led to an upsurge in favour of the return of the soldier-king Constantine. In a general election in November 1920 Venizelos was decisively defeated, the king returned, and Venizelos went into self-imposed exile.

The Greek armies suffered from these national divisions, with Venizelist officers now being purged in favour of royalists, and this contributed to Greece's defeat in 1922 and the evacuation of Asia Minor. The country now turned to Venizelos to save what he could from the wreckage, and in the 1923 Treaty of Lausanne he undoubtedly accomplished what could be done in such adverse circumstances. He returned to Greece briefly in 1924, serving as prime minister for one month, before once again going abroad to live. Shortly after this the monarchy was abolished and a military regime for a while dominated the country. Venizelos re-entered political life in 1928, winning a majority in the general election, and embarked on a four-year premiership. During this period he established good relations with Italy, Yugoslavia, and Turkey, making a highly successful visit to Ankara in 1930. His government, however, suffered from the impact of the world economic crisis which began in 1929, and he had to resign in 1932, serving again briefly as prime minister that year and again at the start of 1933. He ended his political life much as he had started, by taking part in an abortive revolt based on Crete, this time aimed at preventing a restoration of the monarchy. After its failure Venizelos went into exile in Paris where he died in 1936, his body being brought back to Crete for burial.

Biography

Born in Crete in 1864, Venizelos studied in Athens and returned to Crete to practise law. He became active in Cretan politics and was made head of the island's executive in 1899. In 1909 King George I invited Venizelos to Athens. In 1910 he was elected to parliament and became prime minister. His disagreement with King Constantine over Greece's involvement in World War I led to his resignation. He

secured Smyrna for Greece at the Paris Peace Conference but was defeated in elections in 1920. After the Asia Minor disaster in 1922 he negotiated the Treaty of Lausanne. After several more terms of office he went into exile in Paris where he died in 1936.

Verroia

City in Macedonia

This large town of south central Macedonia is one of the few in the region that has enjoyed a more or less continuous existence from antiquity to the present day and has retained its original name over the centuries (the same is also true of Thessalonica and Serres). Verroia stands on the site where it was originally founded, i.e. on the slopes of a hill at the eastern extremities of Mount Vermio, overlooking the vast coastal plain of central Macedonia. In antiquity Verroia lay much closer to the sea than it does now, for the Thermaic Gulf extended so far inland as to include the area of the future lake of Giannitsa. Located in the heart of Macedon, in the neighbourhood of the royal residence and cemetery of Aegae (modern Vergina, where the tombs of the Argead dynasty have been excavated), Verroia was already in existence in the 5th century BC, if not earlier, and was one of the main urban centres of the ancient Macedonian state. The town's name is believed to derive from Veres, a hero of the Macedonian religious tradition.

Being the birthplace of Antigonus I, the renowned general and one of the successors of Alexander the Great, Verroia was particularly favoured by his descendants who ruled in Macedonia as the Antigonid dynasty between 294 and 288 BC and from 277 BC to the end of the Macedonian kingdom in 168 BC. The town's prosperity continued during the Roman era, when Verroia is attested as a place of significant commercial activity and also the centre of the *concilium* (*koinon*) of the Macedonians, an ethno-religious league of the Macedonian towns and districts under Roman rule. A Jewish mercantile and artisanal community existed there by the 1st century AD, a fact that attracted St Paul to visit the town and preach there. The only obscure period in Verroia's history coincides with the so-called Byzantine dark age (7th and 8th centuries). The serious demographic crisis and urban decline that mark the Byzantine Balkan provinces during that period must have affected life in Verroia and the development of the town. This probability is supported by the absence of any record of the town's existence for that period, and also by the fact that the surrounding district was occupied by the Slavic tribes of the Drogouvites and Sagoudatoi that were independent for a long time and had uneasy relations with the Byzantine authorities.

The history of medieval Verroia actually begins in the 9th century when the town reemerged from obscurity. The early 10th-century text of John Kameniatis makes reference to Verroia, which is described as a prosperous town (Böhlig, p. 8), at a time when the Byzantines had reestablished control over that area of Macedonia and placed the Slavic tribes under their yoke. In the same period the bishop of Verroia was a subordinate of the metropolitan of Thessalonica.

Verroia remained under Byzantine rule for most of the Middle Ages, save for rather short intervals of Bulgarian (985–1001, 1205–07), Latin (1204/05, 1207–15/16), and Serbian (*c.*1345–50, 1351–56) occupation. The town was finally occupied by the Ottoman Turks around 1385 and, like the rest of Macedonia, remained under their control until 1912. Byzantine and Ottoman Verroia was one of the largest towns in Macedonia, although its oldest surviving records date from as late as 1519. Its diocese was promoted to the rank of a metropolitan see late in the 13th century.

Verroia was an important centre of Byzantine and post-Byzantine art. Its artistic development is represented in its surviving monuments, namely the old cathedral church of SS Peter and Paul (which was later converted into the Hunkyar Camî, the principal mosque of the town), the churches of St John the Theologian, St Paraskevi (also converted into a mosque by the Ottomans), St Vlasios (13th century), SS Kerykos and Julieta (13th century), and the Resurrection church which was painted in 1315 by the famous Thessalonian artist George Kalliergis. Verroia's development was based on the resources of the surrounding region, particularly on the agricultural production of the coastal lowlands (mainly grain, wine, and fruits), as well as on livestock and timber from Mount Vermio. Moreover, Verroia lay close to an important junction where the coastal road from Thessaly met the route of the Aliacmon, which led to Kastoria and Albania. As a result of the Ottoman conquest, most of the landed estates in Verroia's vicinity passed under the possession of Muslims – in fact many of those estates became *waqf* (i.e. pious endowments) of the family of Evrenos – though Christians could still make their fortune out of trade.

From the 15th century onwards Verroia's history ran in parallel to that of the newly founded town of Naousa, which stood on higher ground on Mount Vermio and is traditionally believed to have been settled by people who left the lowlands of Macedonia in order to escape Ottoman rule. These neighbouring towns were different in many respects. While Verroia became a typical Ottoman Balkan city, which housed every kind of institution that represented Ottoman authority and had a significant Muslim population (approximately 1155 Muslims to 3874 Christians in 1519), Naousa was an exclusively Greek Christian town in a state of self-government. For this reason Greek education and the Greek national ideas, which took shape in the 18th century, found a more hospitable environment in Naousa than in Verroia. During the War of Independence the restless elements of Mount Vermio (a retreat

of the renowned klephts and *armatoles* ("armed men") throughout the centuries of Ottoman rule) and the inhabitants of Naousa were urged to revolt by the town's patriots – Zapheirakis was the most notable among them – which resulted in a military failure accompanied by massacres and the destruction of the town in April 1822. Meanwhile, Verroia remained calm due to the size of its Muslim population – a big proportion of the town's 18,000 people at the end of the 18th century (Cousinéry, 1831, p. 69) — and to its less revolutionary background.

Verroia was finally annexed to Greece in 1912, as a result of the Balkan Wars. The subsequent departure of the Muslim population and the assimilation of whatever other ethnic elements had existed in the town (Evliya Çelebi wrote in the 17th century of a Christian population consisting of Greeks, Bulgarians, and Vlachs) gave Verroia the image of a typical provincial Greek town. Yet contemporary Verroia is one of the biggest towns in Greek Macedonia, with 37,858 people according to the census of 1991, and is particularly wealthy due to the agricultural resources of the surrounding countryside (cotton and fruits being the main products today) and to the development of a considerable industry specializing in food processing.

Summary

The principal town of south central Macedonia, Verroia has had a continuous existence on the same site since antiquity. It was established by the 5th century BC and received favourable treatment as the birthplace of Antigonus, founder of the Antigonid dynasty. Several Byzantine churches survive. It fell to the Ottomans in 1385. Unlike nearby Naousa, which was a hotbed of Greek nationalism, Verroia had a large Muslim element in its population and played little part in the War of Independence.

Village Society

The first traces of permanent human settlement on the Greek peninsula date back to the early Neolithic era, long before its penetration by Greek-speaking tribes around the end of the 3rd millennium BC. Archaeological excavations have revealed remains of permanent settlements of agriculturalists and sedentary pastoralists consisting of densely built single-room habitations surrounded by gardens. Their burial customs indicate a society organized in clans, while the absence of sizeable buildings denotes an egalitarian society without centralized forms of government or administration. Excavations of large private buildings of the Bronze Age with ample storage areas and numerous yards possibly designate the emergence of social stratification.

As we advance into historical times, social stratification became increasingly complex as did the interrelations between the different echelons of the social ladder. The formation of the city state in the 8th century BC, in particular, defined a situation where villages became dependent on urban centres. Village society at the time consisted of independent households of free peasants. The family unit was the economic and social nucleus of a society whose economy depended on agricultural production. However, the majority of peasants were owners of small plots of land that were often insufficient for the subsistence of the household. While peasants were faced with poverty, large landed properties began to form, increasing the social distance between villagers and aristocrats. Peasant contributions, furthermore, were appropriated by the aristocracy, who thus augmented their wealth.

Byzantine villages were fiscal and legal units that consisted of independent land holders. The peasants were poor, but their plot of land secured them their subsistence. Furthermore, village life was far more healthy than life in the city. Monasteries provided education for peasant offspring, while religious celebrations provided the opportunity for feasting. Local festivals held considerable importance for the peasant economy since their open markets were a focus for economic transactions. An important principle in Byzantine village society was that of collective tax liability. Taxes were allotted to whole villages, not to individual landowners, so that if a peasant had had a bad year the rest of the village community had to make up for his share in the taxes. However, in actual fact peasants were overtaxed, and punishment for those in debt to the state was particularly harsh. Village life was further aggravated by invading troops of the empire's enemies, as well as by natural causes, such as drought. This led great numbers of peasants to sell their land, and, during the decline of the Byzantine empire, large landed properties began to form, thus transforming the character of rural Byzantium.

The Ottoman conquest halted these changes. State ownership of the land replaced both family and communal property. Peasants were able to secure their plot of land, but had to pay excessive taxes to the sultan's tax collectors. For reasons of fiscal effectiveness the sultan retained the system of collective tax liability at the level of the community. The village community was further strengthened as it was granted relative administrative autonomy. Local communities were ruled by an elected council of elders. Since land accumulation was not possible, participation in local administration became the new basis for social stratification within villages; the council of elders represented the wealthier sector of the village households who, moreover, often took advantage of their position in order to augment their wealth.

Village Society: two women load a mule in the village of Olimbos

On the eve of Greek liberation village society was characterized by relative autonomy and self-sufficiency; it had its own distinctive social and cultural character and an ethos peculiar to it. Towards the end of the 17th century the Ottoman empire entered a prolonged phase of crisis with repercussions for village communities. The centralized state gradually took over the authority of the semi-autonomous local communities, while the local council of elders became mere functionaries of the state.

The kind of village society that emerged as the continuation of the semi-autonomous communities of the Ottoman era is what has been referred to by folklorists and others as traditional society. Its basic productive and reproductive unit was the extended family household. The family was the primary source of identification for villagers. Village families related through blood or affinity formed a network of relations of cooperation and solidarity within the village. Outside this circle of relatives and affines lay the world of strangers: unrelated, potentially hostile families competing for prestige in the village hierarchy.

What bound unrelated families together into a relationship of solidarity and cooperation, making them transcend possible causes of friction and rivalry, was the sense of belonging to a community. The village community provided the second most important source of identification for the villagers. The relationship of the villager with the community was mediated by the neighbourhood. The neighbourhood provided an important network of relations of cooperation outside the immediate circle of the kindred.

Traditional village society was a society of relative self-sufficiency. It was an endogamous society. Likewise most goods needed for its sustenance were produced within the village itself. Despite the introduction of monetization and the cultivation of cash crops in the 19th century, the production was basically subsistence-orientated.

Traditional village society was a community bound by a set of moral values and beliefs observed by all. Central to its identification as a moral community has been the Orthodox Christian religion. As such, the Church and the religious calendar have played, and still play, an important role in village life. What is particularly revealing of the role of the Church and the Orthodox faith for village society is the annual feast or *panegyri*. This feast, held on the name day of the saint to whom the local church is dedicated, is important because it draws together not only those resident in the village, but their migrant relatives as well, in a celebration of village identity.

The processes of modernization and urbanization that were at work in Greece after the Civil War (1945–49) deeply affected the character of traditional village society. The most profound changes were brought about by the process of rural exodus, which became particularly intense during the 1960s and 1970s. As a result, numerous mountain and island

communities became depopulated and heavily dependent on resources coming from centralized state mechanisms, such as the Ministry of Agriculture, the Agricultural Bank, and recently the European Union. Social relations within villages have been disrupted due to depopulation. Village youth have left for urban centres, leaving villages with ageing populations; houses have been abandoned, impairing the structure and function of the neighbourhood. On the other hand, villages in the plains have developed as satellite communities to urban centres, functioning more and more as city suburbs.

Vine

Viniferous species of grapes (*vitis vinifera sativa*) were known to the Mycenaean Greeks. The mythological account of Dionysus' importation of the vine from Asia Minor, the evidence of wine on the Linear B tablets, and the remains of storage vessels make it clear that by the 2nd millennium BC grape growing was firmly entrenched on the Greek mainland.

Yet only with the rise of the polis (800–300 BC) did domesticated cultivars, which produce larger and better-quality fruits, become truly ubiquitous. The Classical Greeks planted vineyards from the Black Sea to Crete, and from southern Italy to northern Asia Minor, where, along with olives and grains, they became part of the great triad of Greek agronomy – an agricultural diversity that helped to make the ancient rural household self sufficient and the city state prosperous. Vines could grow well on difficult terrain and produce on poor soils; they were resistant to extremities of temperature and humidity, and provided the farmer with in-season fresh fruit and juices, storable raisins, and non-perishable wine. That versatility of the grape prompted the 7th-century BC poet Alcaeus to advise: "Plant no other tree before the vine."

The wide variety of soil and weather conditions in Greece and Italy allowed for regional specialization, as the Aegean islands, the bay of Naples, and Rhodes earned a Mediterranean-wide reputation for premium vintages. There is some practical advice found in Greek agricultural writers such as Theophrastus on establishing the vineyard, but the full sophistication of the Greek art of viticulture can be appreciated only in extant and derivative Latin texts such as Cato, Columella, and Varro. It is clear from these authors that the Greeks translated empirical observation into a more abstract and theoretical knowledge of the proper combination of climate, soil, and vine species necessary to produce premium grapes. Such scientific treatises attest to the Greek mastery of viticulture from the arts of vine trellising, fertilization, pruning, and pest management to the intricacies of wine pressing and processing – a level of expertise not surpassed until the 19th century with the rise of bacteriology, soil chemistry, and plant biology.

The polis Greeks saw viticulture as emblematic of Classical culture at large, whose stable populations, local councils, sturdy yeomen, and fiercely independent rural communities were the natural dividends of the time, patience, expertise, and investment necessary to grow good grapes. Thus vine growers are idealized as dependable, though crusty sorts, in the comedies of Aristophanes and Menander. The livelihood of entire communities might depend on the success of the autumn vintage, and during wartime it was a crucial factor in state policy. In Thucydides' history, for example, the small north-east-Greek city state of Acanthus sued for peace when its grape harvests were threatened by Brasidas and his Spartan invaders; similarly the Acharnian viticulturalists outside Athens were especially critical of the Athenian leaders when their vineyards were left unprotected before the annual Spartan invasions of Attica (431–425 BC).

In Hellenistic and Roman times, agriculture in general and viticulture in particular in the Greek world became increasingly divorced from the Classical ideal of agrarianism and evolved more into a cash enterprise, where large absentee estate holders, through the use of slave gangs and skilled overseers, grew grapes aimed at particular specialized wine markets, often at great distances and throughout the Mediterranean. Athenaeus (*c.*AD 200), for example, provides a comprehensive catalogue of choice regional wines that attests to the sophisticated commercial nature of Greek viticulture in

Vine: interior of a bowl by Execias showing a vine growing above a ship in which Dionysus sails, mid-6th century BC, Antikensammlung, Munich

Roman times. Yet even as exports grew, viticulture ceased to be part of a vibrant countryside, which for the most part suffered continual depopulation due to emigration, banditry, and oppressive taxation.

With the collapse of the Roman empire and during the subsequent Byzantine protectorate, viticulture returned to a more subsistence and local enterprise. There was some renewed commercial prosperity during the Frankish and Venetian occupations of the Peloponnese (13th–15th centuries), when the export of wine and raisins to western Europe increased. The name *currant* (extremely small, dark purple grapes used for raisin production and now variously known internationally as Black Corinth or Zante Currant) is a corruption of the word Corinth itself (*raison of Couraunte*), attesting to the popularity of such raisins that were grown near the isthmus and from the Middle Ages were shipped throughout western Europe. The distinctive resinated flavours of many Greek wines – which often hampered their export value – are an acquired taste and may date back to antiquity, when herbal, spice, and resin preservatives were first used to maintain wine quality during storage and transport. Problems of security and high taxation under the Ottoman empire, along with the continuance of large monasteries and estates with absentee landlords, depressed Greek viticulture, which returned to subsistence levels, largely to provide in-season table grapes, local wines, and a few raisins for export.

Until very recently, Greek viticulturalists have suffered from technological stagnation and the increasing fragmentation of farmland; both developments tended to reduce vineyards to dispersed plots of tiny acreages that involved lengthy commutes and made mechanization nearly impossible. However, during the 1980s there was a veritable revolution in the practice of Greek vine growing. The entry of Greece into the European Common Market in 1981, together with strong government programmes to supply agricultural expertise, capital, and machinery, increased the subsidized export of Greek wines and raisins throughout the world – even as grape growing became no longer one of the central cultural experiences of the small Greek village. Currently, Greece is the world's third largest producer of raisins and there are well over 200,000 hectares planted to various species of grapes. Such guaranteed export profits have sparked a remarkable spread of vineyards on to marginal lands, together with an increase in irrigation in otherwise unfarmable arid soils. At the millennium, the danger grows that historically unprecedented levels of Greek grape production may not be sustainable – given the age-old limitations of rocky soil, difficult terrain, and shallow aquifers. And should lucrative European subsidies be withdrawn, Greek wines and raisins may lose many of their markets to higher-quality and less expensive grape products from America, South Africa, and Turkey. Thus a decline of vine acreage is probably inevitable, part of the boom-and-bust cycle of Greek viticulture that has characterized the past four millennia of Hellenic history.

Vizyinos, Georgios 1849–1896

Short-story writer

Being a distinguished craftsman of lyricism, a skilful and exceptionally competent author of manners, Georgios Vizyinos devoted his short life to the perfection of psychoanalytical writing. Exhibiting an extraordinary ability to describe in every possible detail ordinary events as well as to portray and explore the psychological dimensions and moral tenets of his characters, he shattered old orthodoxies in Greek literature and erected new ones. He pronounced on cultural and social

questions and played a central role in the evolution of modern Greek fiction. He is regarded as one of the forerunners of the modern Greek novel. His tentative experimentation in style, structure, and diction contributed to the development of Greek moral and psychological writing and laid the foundations of modern Greek fiction.

Vizyinos had an adventurous life tinted with energy, spirit, uncommonly romantic visions, moments of great passion and sometimes unfulfilled love. However, paradoxically enough, the last years of his life were spoiled by disillusionment, pessimism, and psychological problems, which turned into a fatal, chronic paranoia. It is no exaggeration to say that Vizyinos is numbered among the less fortunate writers of Greek literature. He was not simply a tender, nostalgic poet but also a gifted author of philosophical, aesthetical, and psychological essays, teaching textbooks, and folklore documentaries. As far as his fiction is concerned, it consists of six stories: "Metaxy Pirea ke Napolis" ["Between Piraeus and Naples"], "To Amartima tis Mitros mou" ["My Mother's Sin"], "Pios Ito o Phoneus tou Adhelphou mou" ["Who was my Brother's Killer?"], "Monon tis Zois mou Taxidiou" ["The Only Journey of my Life"], "I Sinepie tis Palaias Istorias" ["The Consequences of an Old Story"] were all published in *Estia* during the years 1883–84 and a sixth, "Selim Moskov" ["Selim the Muscovite"], though written earlier, was published in 1895. Vizyinos's primary concern in these stories is the depiction of the rural way of life in his native Thrace. In this way, he became the spiritual stimulus and mentor for two of the most distinguished authors of manners, namely Alexandros Papadiamantis and Andreas Karkavitsas, and inaugurator of a whole generation of literature dominated by the figures of George Drosinis, Kostis Palamas, and other representatives of the so-called New Athenian school of poetry.

Vizyinos was born in 1849 in a small village in Thrace with a rich historical past and living folklore traditions which are revived and reflected in his work. With the patronage and support of a wealthy man from Constantinople, Vizyinos completed his higher education in Germany where he became acquainted with classical German literature. He also paid visits to London and Paris. In his stories, he analysed the outward behaviour and manners of his characters but, most importantly, he aimed to expose the conscious and unconscious motives affecting that behaviour. The same psychoanalytical perspective was endorsed later by Papadiamantis, Karkavitsas, Nikos Kazantzakis, Demosthenes Voutiras, and Nikolaos Politis. Moreover, his work was pervaded by a genuine feeling of patriotism which he inherited from Andreas Kalvos and Dionysios Solomos, and a deep religious faith would be passed on later to Photis Kontoglou. By relying on a Pindaric lyricism and sensual appeal, he delivered a precise depiction of the Greek natural landscape with specific reference to his home and the cordial relations of its people, who were in close contact with Turks. In this way, his work gives a credible historical account of his time while simultaneously it epitomizes the ancient Greek ethos.

Vizyinos's main persona, dominating his work, is that of an unfortunate mother figure, a common theme in the Hellenic literary tradition. The same motif appears first in the pages of ancient Greek tragedy, is fashioned in popular culture, and is transplanted to modern fiction. Another topos that repeatedly occurs in his stories is that of the mystery of human psyche. In other words, he professed the unpredictability of human behaviour, which is dependent on the psychological condition and the special external circumstances affecting the actions of human beings. Thus, it is not accidental that the most sensitive people sometimes display ill-mannered behaviour. Vizyinos had undergone a similar psychological metamorphosis when personal troubles transformed him into a gloomy unconfident man.

An equally important place in his work is occupied by the phenomenon of emigration (expatriation) with specific emphasis given to its emotional parameter. Vizyinos wrote about the classic model of the reluctant exile that prevails in the Hellenic literary tradition from Homer to Kalvos till today. It is the idea of diaspora combined with the nostalgia for return. Vizyinos's stories also contain the idea of the human soul seeking revenge for any injustice as well as the notion of humanity's power to replace dissension and enmity with harmony and unity. With reference to the first idea, he was reproducing one of the pivotal dilemmas of ancient tragedy. As far as the second idea is concerned, he glorifies the principle of altruism, generosity, and humanitarianism.

Finally, he commented on much more difficult philosophical themes such as the eternal conflict between reason and emotion, mind and soul, and logic and sensation. Each of them represented a completely diverse world: the first represents the world of critical mind and rational thinking, of strong arguments and scientific thought, while the other is that of spontaneous emotions, sentiments, and passions. Once more, Vizyinos pays homage to the world of ancient tragedy and reemphasizes the theme of Sophocles' *Antigone*. Closely related to these ideas in Vizynos's work is the notion of human mania (frenzy), the turbulent and disordered state of mind. He considers such a theme either by stressing its tragic dimension or its comical alternative. This double treatment of human mania is endorsed by Papadiamantis.

Vizyinos's works overflow with a lively, animating imagery, and are marked with elegance and clarity of style, elaborate, effective dialogues, and rich, vibrating plors. All of his characters undergo an inner conflict and suffer a personal ordeal. Their tragic element is intensified by their ignorance (like that of Oedipus) of their fate. Vizyinos insisted also on an unusual idiom. Whereas his narrative is written in a dense, archaic, but pleasant idiom, his dialogue is enriched with a vernacular language enlightened with local expressions and jargon. In this way, Vizyinos's idiom stands as a bridge between the old-style language of the past and the vernacular of the future without neglecting the accents of the periphery.

Vizyinos was a tragic figure and at the same time a gifted writer who made a profound contribution to the Hellenic literary tradition. He was considered the renovator of the Greek literary model and the founder of psychoanalytic modern Greek fiction. His work is filled with national folk-traditions and is inspired by nostalgia for the past. His task was to present customs and emotions as well as high ideas to his own generation and to impart knowledge of them to the next. His stories appeared in a transitional period for Greek literature marked by spiritual stagnation, conventional ideas, and decline. In the face of bitter criticism from his opponents and the conventional literary milieu of his time, which could not

understand his lasting message, he became disillusioned and disappointed, and his work was destined to receive only posthumously the recognition it deserved.

MARIA ROUMBALOU

Biography

Vizyinos (whose real name was Michaelides) was born in Vizyi, a small village in Thrace, in 1849. With the support of a wealthy benefactor he was educated in Athens and later in Germany where he studied philosophy and psychology. He became a professor of philosophy at the University of Athens and wrote essays and textbooks as well as short stories. In 1892 he was confined to a mental hospital and died in Athens in 1896.

Vlachs

Ethnic group from the Balkan mountains

The Vlachs, who call themselves Aroumanians and in Greece are known as Koutzovlachs or by a host of regional names, are found in scattered pockets throughout the Balkan peninsula. In Greece they are principally settled in the Pindus mountains around Metsovo. At the beginning of the 20th century there were in the Balkans about half a million people speaking Vlach, a Latin language akin to Romanian. Now this number has been reduced to about 100,000 with only a third of this total living in Greece. Exact numbers have always been difficult to calculate owing to the political dimensions of the question, the migratory habits of the Vlachs, and the fact that almost always Vlachs will be fluent speakers of the language of the country in which they are located.

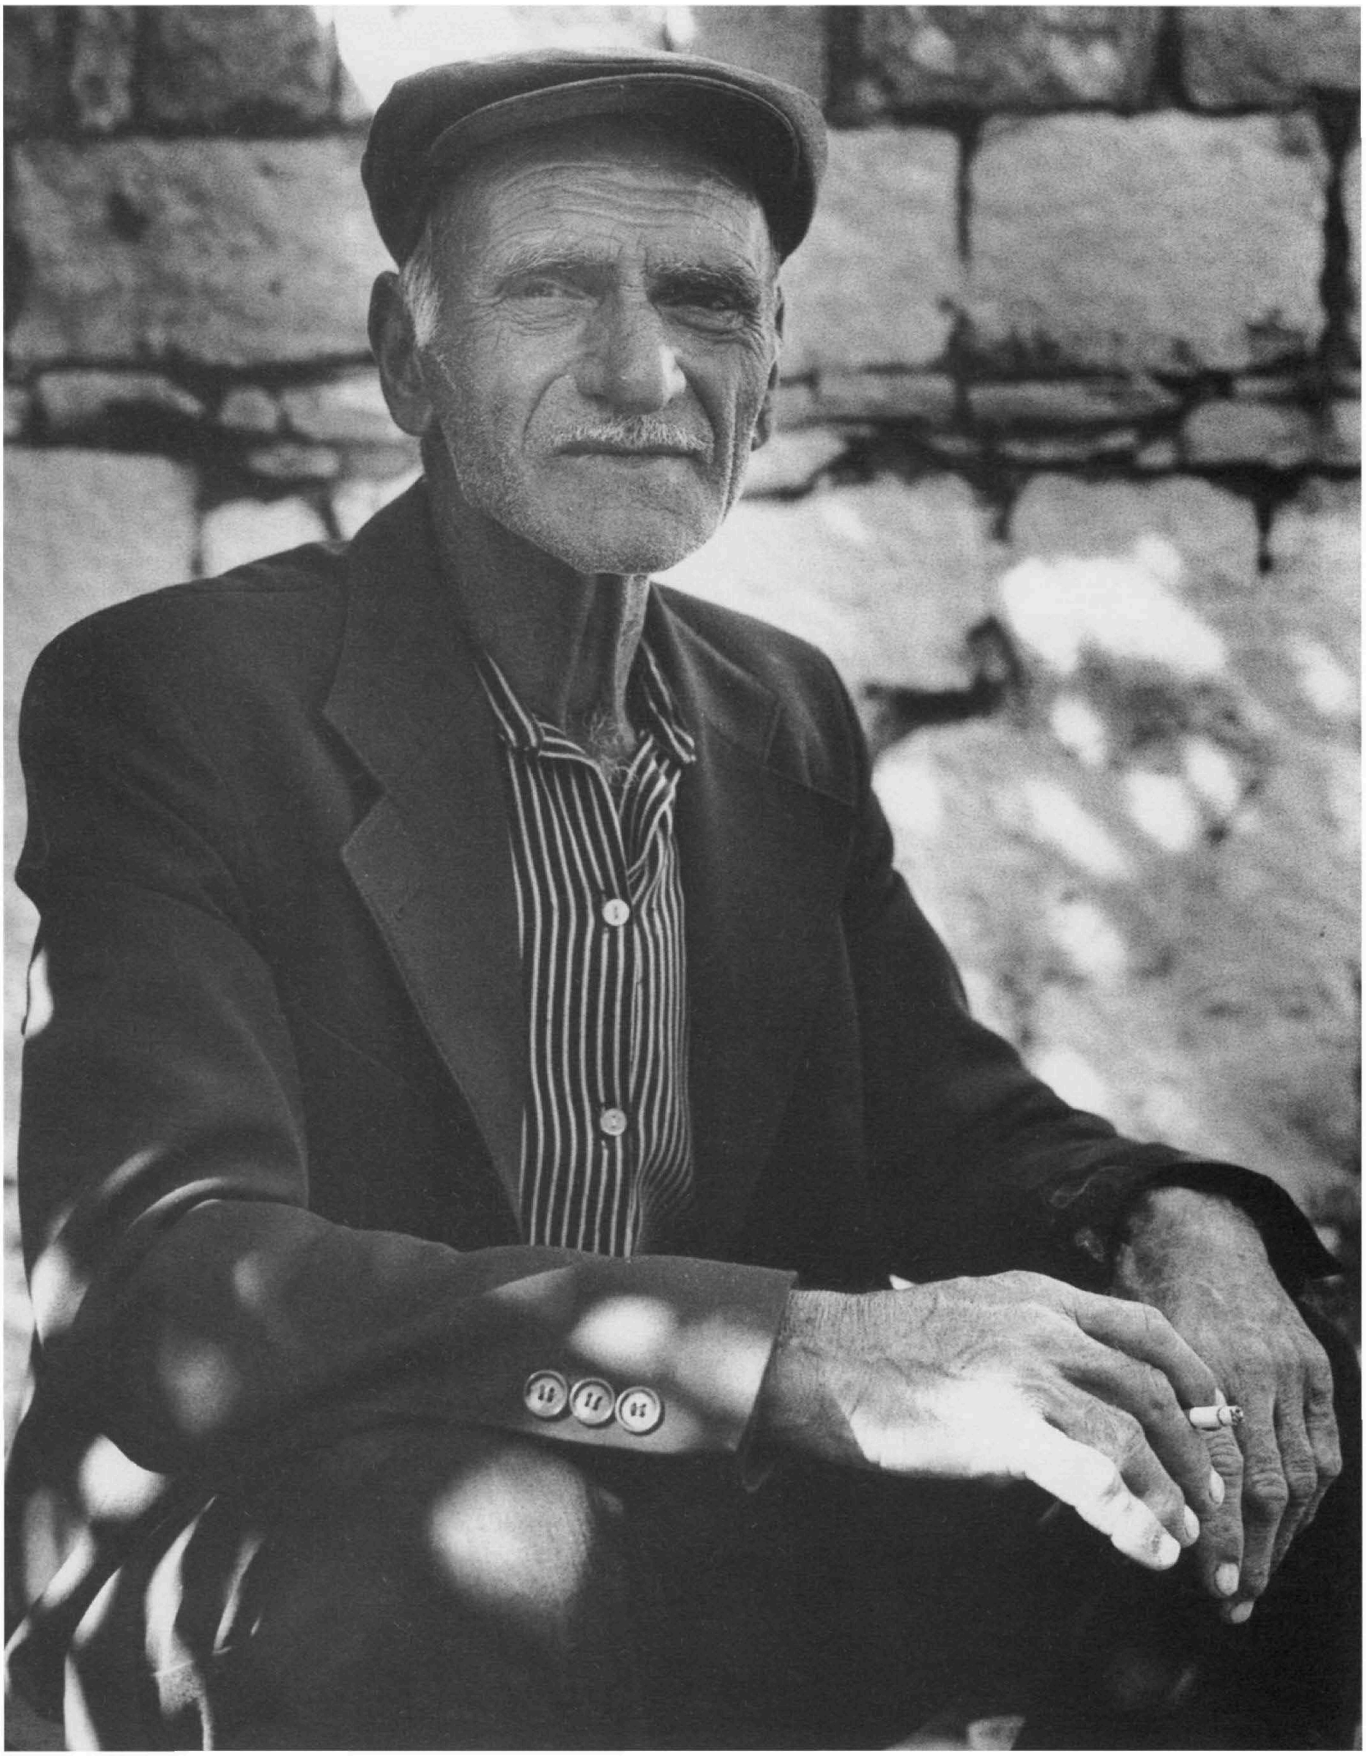
It is equally hard to be exact about Vlach history. Almost all are staunch members of the Orthodox Church, and most Vlachs have followed a Greek nationalist line. Greek and Vlach historians are therefore anxious to prove the long association of the two ethnic groups, and have therefore concluded that Vlachs are the descendants of Roman legionaries, guarding the mountains and marrying Greek speakers. There is little evidence for this theory, which is inherently improbable. Romanian historians, anxious to use the Vlachs as counters in Balkan politics, assume that they left Romania in the Middle Ages, although again we have no evidence or explanation why difficult areas like the Pindus mountains should be attractive to migrants from the Danube.

Even after the collapse of the western Roman empire there were Latin speakers in the eastern half of the empire, mainly settled along the Danube frontier and in the province of Illyricum, roughly corresponding to modern Yugoslavia. The emperor Justinian (527–65) was such a Latin speaker. Just before the collapse of the Danube frontier we hear of an incident in 586 in which two muleteers in a Byzantine army appear to be speaking Vlach. When in 602 most of the Balkan peninsula was lost to the empire and there were massive Slav incursions, Latin speakers must have been involved in these movements of populations, journeying southwards with the invaders or to escape from them. They could thus have reached their present dwellings by the 7th century, although it is difficult to talk of dwellings with any confidence since in both medieval and modern times the Vlachs have been associated with transhumance, moving to the mountains in summer and the plains in winter.

There are no references to Vlachs between 586 and 976. This lack of evidence is hardly surprising in view of the almost total silence of Byzantine sources about events in the western and central Balkans when these areas passed out of the empire's control. With the 10th-century recovery the Vlachs are mentioned quite frequently, although some references to Vlachs may be to shepherds or nomads rather than to Latin-speakers. Most Byzantine sources comment on the Vlachs' migratory habits, their connection with sheep, and a tendency to treachery, perhaps engendered by the fact that as transhumants they were hard to fit into any administrative system. Transhumants make poor taxpayers.

In 976 certain Vlach *hoditai* ("road-men") killed David, the brother of the future Bulgarian emperor Samuel, in the area between Kastoria and Prespa. *Hoditai* is ambiguous; it is not certain whether the Vlachs so described were there to guard the roads or to pillage them as highwaymen. Perhaps as with *armatoloi* ("armed men") and klephts, the distinction was not a precise one. As with the muleteers of 579, the *hoditai* of 976 were involved in trades that Vlach merchants of the 18th and 19th centuries sending baggage trails of mules along the highways of the Balkans would easily recognize. It is not clear whether on this occasion the Vlachs by killing David were acting on the Byzantine side, the position being made more obscure by the fact that it is not certain whether David and Samuel were themselves originally in the Byzantine service. It is just possible that David and Samuel may themselves have been Vlachs.

There are Vlachs today between Kastoria and Prespa. More can be found in Thessaly where in the 11th century Benjamin of Tudela speaks harshly of their unreliable behaviour. There was a scandal on Mount Athos involving Vlach women. In 1194 a revolt in the Haemus mountains led by the Asen brothers brought into being the second Bulgarian empire. Most contemporary sources refer to this as a Vlach empire, although Bulgarian historians play this down. Romanian historians like to think of the Vlachs as being really Romanians, and the Haimos mountains are fairly close to the Danube, although at its greatest extent the second Bulgarian empire would have included a great deal of territory now inhabited by Vlachs.



Vlachs: portrait of a Vlach man in Voskopje, eastern Albania

With the collapse of the Byzantine empire at the end of the 12th century the lawless Vlachs would seem to have profited. Thessaly became known as Vlachia, and there were ephemeral Vlach states. We also hear of Vlachs joining the Albanian incursions into Greece. Our sources are not particularly helpful about ethnological matters. A certain Boncoes in the early 15th century is called *Serbalbanitobulgarovlachos*, suggesting that in the Middle Ages, as at the present time, many Vlachs spoke more than two languages. Metsovo is referred to for the first time in 1380. By this time the Turks had entered the Balkans. On the whole the Turks were not too interested in the ethnology of their various subject races, but there are some mentions of specifically Vlach villages in Ottoman records.

Most Vlachs remained under Ottoman rule until the Balkan Wars of 1912–13. On the whole they prospered. The Ottoman authorities tended to favour local arrangements over taxes, and the Vlachs made several advantageous bargains in this respect. A strong central government protected trade, and as merchants the Vlachs with raw materials from their sheep and transport with their mules were in a good position to take advantage of this trade. In the 17th century the Ottoman empire began to decline, and its frontiers to recede, but this meant new markets and avenues for trade, particularly in central Europe, where Vlachs established prosperous businesses.

It is to the 17th century that we can date the formation of many Vlach villages. Such villages now seem poor and remote, although occasionally a large if battered mansion hints at former prosperity. As merchants and as owners of large flocks of sheep some Vlachs became extremely wealthy and such houses reflect this wealth. A particularly wealthy Vlach centre was Voskopoje in southern Albania where as well as large houses and fine streets there was also an academy and a printing press.

In the late 18th century Voskopoje incurred the wrath of Ali Pasha, the virtually independent ruler of southern Albania and Epirus. His Albanians destroyed the city, and the inhabitants fled to other Vlach centres in the Balkans. This diaspora probably strengthened the presence of Vlachs in the Balkans, but the story of Voskopoje illustrates the difficulties that they faced when Ottoman authority collapsed. With the breakdown of law and order Vlach prosperity was reduced. The future might seem to lie with the new national states, but here the Vlachs were in something of a dilemma. Though speaking Vlach at home, the merchants of Voskopoje would naturally use Greek in commercial business, and Greek was the language of the academy and printing press. Vlach was rarely written, and there was no standard grammar or orthography. Greek schools and priests encouraged Greek and discouraged Vlach.

Not surprisingly many Vlachs became fervent Greek nationalists, most notably Rigas Velestinlis, a visionary poet and patriot, author of the Greek national anthem, but a Vlach from Velestino. The first prime minister of Greece, John Kollettis, was a Vlach from Sirrakou. Some of the finest buildings in Athens were erected owing to the munificence of Vlach families such as the Averoffs from Metsovo and the Sinaias, originally from Voskopoje. Other Balkan nationalities were slower than the Greeks in asserting their claims, and it was not until the end of the 19th century that the Romanians started to promote the idea that Vlachs were really Romanians.

Their campaign was not very successful. Schools, though they cost the Romanian government a great deal of money, were not well attended, attracting perhaps a quarter of the population, generally the poorest quarter. There was no real Vlach church, although eccentrically and heroically Apostol Margarit (1832–1903) tried to start one. There were differences between Vlach and Romanian and between different dialects of Vlach. Romania was a long way away from the Pindus mountains.

Economic problems were as pressing as political ones. Vlachs, accustomed to lengthy journeys, found new boundaries and customs dues a barrier to migration and trade. Metsovo, just to the north of the Greek border of 1887, experienced a period of economic decline. The guerrilla campaigns in Macedonia led to hardship and persecution. Generally Vlachs were on the Greek side, but we sometimes find them supporting Bulgarians, taking a pro-Romanian line, or even allying themselves with the Turks. The Ilinden rising of 1903 began in the Vlach town of Kruševo north of Bitola and spread to the Vlach villages now in Greece of Neveska and Pisoderi. Though some Vlachs were involved in the revolt, and severe damage was done to the Vlach quarter in Kruõevo, the Ilinden rising was not a Vlach rebellion any more than it was an uprising of the Slav Macedonian nation or the proletariat against the bourgeoisie. In 1905 the Ottoman authorities recognized the Vlachs as a separate *millet* (community), a move probably intended to divide their subject races in order to rule them, but the days of Ottoman rule were almost over.

The Balkan Wars were fought over Vlach territory and the subsequent peace treaties divided the Vlachs among the various Balkan states. World War I produced new battles and new frontiers. None of these wars was good for the Vlachs. Their attempts to win a hearing in the peace treaties were generally unsuccessful, although Greece did allow Romanian-sponsored schools in its territory. Some pro-Romanians in Greece left for Romania, others to America. The Greek refugees from Turkey made northern Greece much more ethnically homogeneous, and the assimilation of the Vlachs proceeded apace.

World War II and the Greek Civil War did further damage to Vlach mountain villages. Attempts by the Italians to show friendship to the Vlachs as fellow Latins were fairly futile, and did not help the Vlach cause. Material progress after World War II, bringing non-Vlachs to Vlach villages, making some villages inaccessible, and turning the biannual migration into a summer holiday, increased the process of assimilation. It is remarkable that Vlach has survived so long. The census of 1951 recorded that there were 39,855 Vlach speakers in Greece. This is probably an understatement, but numbers would have declined in the next 40 years, perhaps to be revived by an interest in minorities and the discovery of Vlachs in other parts of the Balkans and among the Vlach diaspora.

T.J. WINNIFRITH

See also Transhumance

Summary

Vlachs are a transhumant people speaking a Latin language that is similar to Romanian. Their origins are obscure. They inhabited the mountainous regions of the central Balkans and northern Greece,

where they prospered as merchants and muleteers. They have declined in numbers since World War II. The census of 1951 recorded fewer than 40,000 Vlach speakers in Greece.

Volcanoes

Humanity has always had an ambiguous relationship with volcanoes. Volcanic eruptions can be tremendous forces of destruction, but soils produced by the weathering of volcanic rocks are very fertile in the right climate. For the archaeologist, eruptions can preserve aspects of communities almost instantaneously. The earliest record of a volcanic eruption is a wall painting from Çatal Hüyük, central Turkey, dating from 6200 BC. This is beyond the scope of this volume and here only the volcanoes of post-Stone-Age Greece and Italy will be discussed.

The recently active volcanoes of Greece lie along an arc from Corinth to Nisyros, near the Turkish coast. They are produced by the melting of the Mediterranean sea floor as it is subducted beneath the Aegean region. The sea floor descends at an angle of about 45 degrees until parts of it melt at a depth of 150 km. The magma (molten rock) then rises and is stored in chambers at depths of 5 to 10 km before eruption.

The most famous Greek volcano is Thera (Santorini). It had been dormant for a long period before the famous "Minoan" eruption in 1450 or 1650 BC – the exact date is still disputed. Before the eruption the present bay was probably almost filled with a volcano, similar to but larger than the present Kameni islands. The eruption started on this volcano and quickly destroyed it, creating a caldera (giant crater) 8 km in diameter. At its maximum the cloud of volcanic ash rose to more than 35 km in the atmosphere and was dispersed as far as Turkey, Israel, and Egypt. On the island the ash was up to 40 m deep and buried all the settlements, including the well-preserved village now known as Akrotiri. Towards the end of the eruption parts of the island collapsed into the caldera. These giant landslides, or particularly violent episodes of the eruption, produced a tsunami (tidal wave) more than 40 m high. Such a wave must have caused considerable erosion, damage to coastal communities, and the salination of agricultural land on nearby islands. These destabilizing effects may have led to the collapse of the Minoan civilization on Crete.

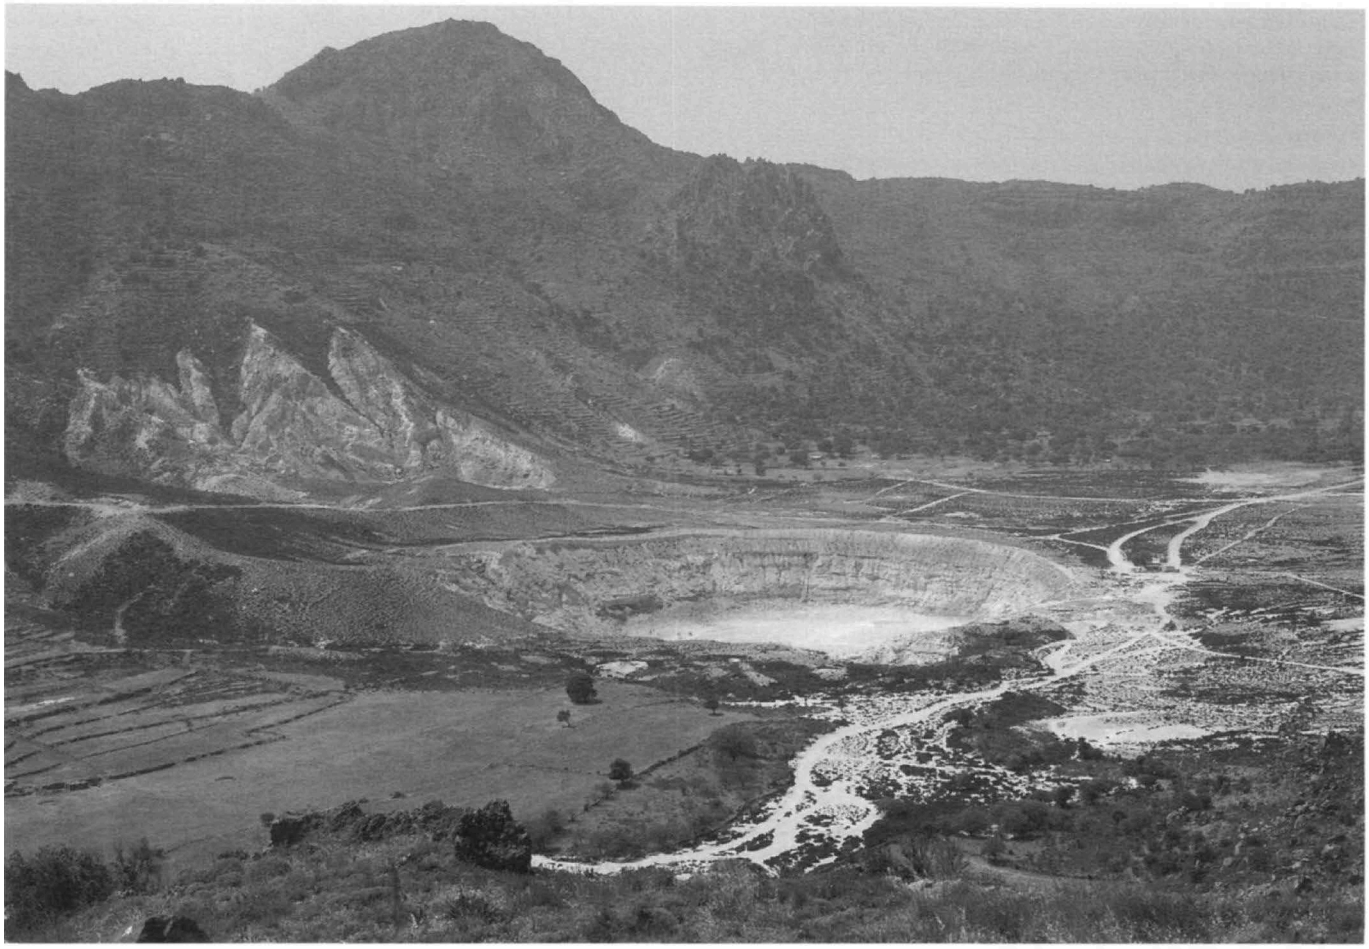
Since then, sporadic minor lava eruptions have created the Kameni islands. The only violent eruption was in AD 726, when so much pumice was produced that it reached Constantinople. There it was noticed by Leo III who interpreted it as a sign of divine displeasure and imposed iconoclasm. The last eruption was a minor one, in 1950. Another volcano 15 km northeast of Thera erupted in 1650. It started underwater and built up a small island, which was rapidly eroded below sea level. Gas from this eruption killed animals and people on Thera.

The largest volcano of this arc is Melos and its archipelago. Volcanism started 3 million years ago, but essentially finished 100,000 years ago. In antiquity the most important volcanic product of the island was obsidian, a natural glass that occurs in ancient lava flows. It was used for knives from the 9th century BC. Recently, exploitation has turned to clay (kaolinite and bentonite) and volcanic ash (perlite). The easternmost volcano of the chain is Nisyros, a small island that has not had any eruptions of lava during historical times. However, there have been a number of steam explosions caused by the interaction between rainwater and magma at shallow depths. These made an impressive series of craters in the interior of the island, the last in 1887. Another small volcano is the peninsula of Methana, in the Saronic gulf. Fresh lavas in the northwest may have been erupted in the 3rd century BC.

In Italy there are recently active volcanoes around Naples (Vesuvius and the Phlegraean fields), on the Aeolian islands, and in eastern Sicily. As in Greece, this volcanism is related to the subduction of the Mediterranean sea floor. Here, however, the geometry is more complex and no single arc has formed. Mount Vesuvius is probably the best-known volcano in the world. The oldest parts, known as Mount Somma, started to form some 12,000 years ago. Construction continued intermittently until 1100 BC, when the volcano was about 2,000 m high. A long period of repose ended with the famous eruption of AD 79, when the top of the mountain was completely removed in three days. A cloud of volcanic ash rose to 30 km and fell on the surrounding countryside: Pompeii was buried to a depth of 7 m. Rain falling on the ash near the vent transformed it into hot mud flows that swept down and engulfed Herculaneum. Eruptions of ash since that time have partly filled the crater to form the present cone of Vesuvius. Most of these were small, except that of 1631. The last eruption was in 1944.

The Phlegraean ("burning") fields volcanic area lies just to the west of Naples. It comprises more than 50 small ash cones, some under the gulf of Pozzuoli. A large magma chamber underlies this region at a depth of a few kilometres. Magma movements can produce rapid changes in the height of the land. The effects of these changes can be seen in the Roman market place (Serapheum), where marine molluscs drilled holes in the columns at a height of several metres above the present sea level. The most recent eruption produced Monte Nuovo in 1538.

Most of the Aeolian islands are volcanic, but only three are of interest. Lipari was a major source of obsidian in the western Mediterranean. It was obtained from lava flows erupted during the 4th millennium BC. The last eruption was in AD 729, when up to 200 m of pumice was deposited in the north, burying the Roman acropolis. The eruption terminated with new flows of obsidian. The island of Vulcano has two independent volcanoes, Fossa and Volcanello, which were linked by an isthmus during the 16th century. Fossa has generally been more active with explosive eruptions about twice a century. The last eruption was in 1886–89; hence we can



Volcanoes: view of the caldera of Nisyros-Stephanos

expect a new eruption soon. Stromboli is a small, almost perfect, volcanic cone that has been active for at least 2,500 years. However, the activity is not generally intense and consists of small explosions every 5 to 10 minutes from the summit craters. These are caused by large gas bubbles that rise up the narrow conduits and burst, scattering parts of the bubble wall.

Mount Etna, the mythical forge of Vulcan and also home of the Cyclopes, is the largest volcano in Europe but also one of the youngest – it was mostly formed during the last 150,000 years. The volcano has been almost permanently active for at least 2,500 years. The lava flows from fissures or small ash cones on the flanks of the volcano and more rarely from the summit craters. At other times there are explosions and small eruptions within the craters.

Volos

City in Thessaly

Volos is the capital of the nome of Magnesia, the chief port of Thessaly, and a regional commercial and industrial centre (particularly during the period 1860–1980). It stands in the deepest recess of the gulf of Pagasae, between Mount Pelion and the coast, on slightly sloping ground. It is the sixth biggest municipality in Greece with a population of some 100,000.

In the Bronze Age the site was occupied by the city of Iolcus, from where the Argonauts set out on their quest to bring the golden fleece back to Greece. Homer reports that Iolcus was a city in the kingdom of Eumelos and Herodotus records that the

city was given as a present to the tyrant Hippias when he was exiled by the Athenians. Despite the importance of the place, systematic archaeological excavations have not been performed because the site is inhabited. Also close to modern Volos was the ancient city of Pagasae (600–353 BC) and on the same site flourished from AD 393 to 1423 the town of Dimitrias, built by Demetrius Poliorcetes. The first dwellings of the modern city of Volos were constructed in 1833. A small pre-existing residential area was occupied by the Turkish authorities.

The derivation of the city's name is not known with certainty. There are two prevalent opinions. The first argues that the name is derived from the Slavic *gol* (deserted) or *golos* (administrative centre); the second that it is a corruption of the name Iolcus, in Turkish Giolkaz, from Giolkas, Golos, and finally Volos. The problem is that until the 12th century the region was known as Iolcus, but after 150 years the ancient name disappears and the area is mentioned as Golos. At Volos the Byzantines erected a great castle that fell to the Turks in 1389. The Christian population took refuge in Mount Pelion and the Turkish army and a few Turkish families occupied the city. Despite having been destroyed by the Venetians, the castle was fortified and rebuilt by the Turks and became one of the most powerful in Greece. During the revolution of 1821 it was defended vigorously and was not taken by the Greeks. A squadron of the Turkish navy, stationed in the port of Volos, was destroyed in 1827 by the Greeks, but again the castle prevented the capture of the city.

The economic development of Volos began at the end of the 16th century, beginning with the fair that took place twice a week outside the castle walls. The country people from the Pelion area traded their merchandise there. Because of the restricted area and the arrival of merchants from all over Greece, the need arose for a suitable harbour from which to export the products of Pelion. A port was built on the beach beside the castle and during this period the first European merchant ships arrived in Volos.

The city started to flourish after the end of the Greek revolution, when its port became the trading centre for Greeks from all over Thessaly. In 1833 the first coastal dwellings were built. In a few years, the seashore had been transformed into a fine residential area following European models. Consulates from Austria, Britain, France, Italy, and Greece were located there. In 1860 Volos had 80 dwellings and, by 1880, more than 1,000 European-style residences had been built. After the annexation of Thessaly to Greece in 1881 the Turks surrendered the castle. This was later abandoned by the Greek authorities and finally destroyed. Once part of the Greek state, Volos quickly became a commercial and industrial centre, and its cultural activities were equal to those of Athens. By the start of the 20th century, the city was a focus of progressive thought and one of the first places in Greece where socialist ideas found fertile ground. At the city's girls' school (Parthenagogion) innovative educational methods were applied. The acute agricultural problems, particularly over the redistribution of land from the aristocracy to the peasantry, led to many revolts and confrontations with the state in the years before 1920. Volos was the birthplace of the principal revolutionary ideas. The poor working conditions and the inadequate income of industrial workers made the city one of the first in Greece where a Labour Centre (1908) was established. This became one of the founding members of the Confederation of Greek Labourers (Geniki Sinomospondia Ergaton Ellados). The predecessor of the Labour Centre was the Panergatikos Syndesmos Volou (All-Labour Association of Volos) (1907) which reinforced the notion of workers' solidarity in a town that was experiencing a steady process of urbanization. Its aims were the promotion of the workers' moral and cultural development, the bolstering of their consciousness as regards their rights as citizens and as working class, the enactment of protective social legislation, and the proffering of mutual support to any of the workers' material and moral needs. The city accepted many refugees from Asia Minor after the disaster of 1922, and these were employed in Volos's thriving spinning mills and cigarette factories. The port, which suffered severe damage during World War II, handled most merchandise arriving from the Middle East.

Nowadays Volos is well placed to benefit from the development of tourism in the Pelion region and the islands of the northern Sporades but it has lost its preeminence as an industrial and commercial centre.

DIMITRIOS GKAMAS

See also Pelion

Summary

Volos is the chief port and commercial centre of Thessaly. As ancient Iolcus it was the point of departure for the Argonauts. Ancient Pagasae was also nearby. During the Tourkokratia the Christian population fled to Mount Pelion. Commerical development began in the late 16th century and expanded in the mid-19th. In the early 20th century Volos was a focus of revolutionary ideas.

Votive Offerings

Strictly speaking, the term "votive offering" signifies something dedicated in consequence of a vow. Partly because the exact circumstances of a dedication are not always known,

partly because a gift to the gods can almost always be taken to imply some kind of a vow, the category is elastic.

Comparison of the modest tin votive plaques readily available to worshippers in Greece today with the terracotta plaques or representations of parts of the human body from the ancient (4th century BC) sanctuary of Asclepius at Corinth or, on a larger scale, with the stone relief of a leg from Epidaurus demonstrates the identity of practice. Furthermore the existence of early Christian votive plaques supports the idea of a continuous tradition.

More substantial gifts to churches from the early Christian period onwards (furniture, church plate, icons) can often be seen to be votive from accompanying inscriptions, and the votive dedication of churches themselves in Byzantine and later times is demonstrated by the known origins of numerous chapels in the Greek countryside and elsewhere. Similar gifts to sanctuaries, deities, or other superhuman authorities are attested in antiquity by inscriptions and literary sources as well as the objects themselves. Ancient figurines and statues are regularly inscribed ("Mantiklos dedicated me to Apollo"; "The Messenians and Naupactians dedicated |this statue| to Olympian Zeus as a tithe of the spoil of their enemies").

The custom of making votive offerings may well go back into prehistory, since some of the objects found in prehistoric shrines, such as the terracotta animals in Minoan peak sanctuaries and in other sacred places, seem certainly votive. The subject is best presented with primary reference to antiquity.

Since the definition of a votive offering is by the intent of the donor, whether an individual or a group, and is dependent also on economic circumstances, the range of types, sizes, material, and value is immense. The material may be perishable (vegetable), cheap (wood, terracotta), or more valuable (stone, metal, precious metal). The type may be anything from a wreath, a candle, or a tiny object to a building. The treasuries (small temple-like buildings but without colonnades) that individual Greek states erected in sanctuaries to house the ritual equipment that their representatives used on ceremonial occasions were a kind of votive offering, intended to glorify the sanctuary and its patron deity. Temples such as the Parthenon, which were additional to the temple that housed the cult statue of the sanctuary, could be votives. If the item concerned was itself representational, or else decorated with figures, possible subjects include images of the deity addressed, images of the worshipper (often with the intention of making permanent an act of piety depicted, e.g. the bringing of an animal for sacrifice), images of sacrificial animals, or sacred objects. Otherwise, attractive or precious items of any kind at all could be offered. Occasions of offering can be summarized by quoting the chapter headings of Rouse (1902), with some additional comments.

Rouse's categories are: (1) to the dead, heroes, chthonian deities (in anticipation of or gratitude for help or favours); (2) tithes, first fruits, kindred offerings (whether crops or the products or profits of trade or business); (3) war (spoils, commemorative statues, etc.); (4) games and contests (prizes, instruments, commemorative statues); (5) disease and calamity (models of the diseased part; an inscription relating a cure); (6) domestic life (items relating to marriage and childbirth); (7) memorials of honour or office (herms, honorific statues or reliefs); (8) memorials of feasts and ceremonials (inscribed vases, representations of the animal sacrificed or the votary carrying a sacrificial animal or object); (9) propitiation (offerings given in redress for impiety, such as the "Zane" statues at Olympia); and (10) rarities and valuables (as the due of deities).

Voulgaris, Evgenios 1716–1806

Intellectual

Voulgaris was one of the most eminent ecclesiastical and learned figures of the Greek world in the 18th century. Born in Corfu in 1716 as Eleftherios, Voulgaris assumed the name Evgenios upon his ordination as a deacon. His initial studies were completed in the Ionian islands. Between 1740 and 1742 he stayed in Italy studying and serving the Greek community of Venice as a preacher. From 1742 to 1761 he taught at various schools in Ioannina, in Kozani, on Mount Athos (Athonias Academy), and finally in Constantinople (Patriarchal Academy). His innovative teaching as well as the western ideas that he introduced provoked the reaction of several Orthodox traditionalists, who, apart from personal rivalries, accused him of heresy and even of atheism. He was thus forced to resign or to escape in order to avoid further confrontations with this conservative religious and social establishment.

In 1763 Voulgaris finally left for Germany (Leipzig and Halle) to continue his studies. There he familiarized himself with German rationalism and the latest scientific developments. He also published some of his writings and translations including his influential *Logic* (Leipzig, 1766). In 1771 Voulgaris was invited to Russia by the empress Catherine II to become librarian and curator of antiquities at her court in St Petersburg. Voulgaris accepted this invitation, which should be understood in the light of the growing Russian interest in Greek antiquity and in the Orthodox populations of the Balkans. After the end of the Russo-Ottoman war of 1768–74 and the treaty of Kuchuk-Kainardji, Voulgaris was appointed from 1775 to 1779 archbishop of the diocese of Kherson and Slaviansk in Novorossia, the strategic new frontier of the Russian empire. After his retirement Voulgaris stayed in Poltava and Kherson until late 1788 when he returned to St Petersburg. There he lived for the rest of his long life, studying as well as revising his previous works. Many of them were published in the early 1800s through the financial support of the Zosimades brothers, a wealthy Greek merchant family. Voulgaris died in 1806 in the Aleksandr Nevskii monastery in St Petersburg.

Voulgaris is rightly considered an outstanding intellectual and theologian of the 18th century. Although he has had many enemies and opponents, his numerous contributions to the Greek people were highly appreciated even during his lifetime. Voulgaris was usually referred to and known at that time only by his first name (Evgenios). It was deemed a great honour for someone to have been a pupil of the "celebrated Evgenios", whose definitive flight to Germany was considered an irreparable loss for Greece. Adamantios Korais called Voulgaris the doyen of the Greek intellectuals of his age, while Josephos Moisiodax considered him "the living library of polymathy".

Voulgaris was a real polymath and polyglot. His interests were manifold and encyclopedic, ranging from philosophical and scientific to theological and historical, as manifested in the wide range of his numerous publications (see Batalden, 1982, pp. 148–72). He attempted to combine the religious humanism of the Orthodox east with western philosophy and rationalism. Among other things, Voulgaris contributed especially to the renewal of Greek philosophical thought on the basis of western developments including the work of Francis Bacon, René Descartes, Gottfried Wilhelm Leibniz, John Locke, C. Wolff, J.B. Duhamel, E. Purchot, J.F. Wucherer, A. Genovesi, W.J.S. Gravesande, and others. Proclaiming the freedom of thought from the chains of outdated authorities (e.g. Scholastic Aristotelianism), Voulgaris moved Greek thought beyond the Neoaristotelianism which was established in Greek schools. He introduced an eclectic form of philosophical inquiry in order to profit from the major systems and move towards the construction of a "sound philosophy", but without upholding them as absolute and infallible authorities. In a similar manner, Voulgaris's influence was instrumental in renewing the scientific thought of Greece on the basis of new theories and discoveries (e.g. by Galileo, Newton, and Andreas Segner). Yet, in some cases Voulgaris showed a reluctance to accept novel theories and criticized them. Motivared probably by religious concerns, he rejected heliocentrism and resorted to the compromising Tychonian world system that posed no threat to the authority of the Bible.

Voulgaris's religious thought was firmly anchored in the Orthodox tradition. He repeatedly defended the Orthodox Church against the Roman Catholics and against the anti-Christian atheistic trends of western Enlightenment. He wrote a compendium of dogmatic theology, polemical and exegetical works as well as a treatise on religious tolerance. Voulgaris was fond of Voltaire and translated some of his works into Greek, but he did not share his antireligious sentiments. Generally, Voulgaris's preoccupation with western ideas did not alienate him from his Orthodox background. He accepted a moderate Enlightenment in which religion occupied a central role and determined his overall objectives. He never intended to compromise his highly valued Orthodox faith. He also tried to distinguish clearly between the areas of jurisdiction of faith/revelation and reason. After all, from his youth Voulgaris was a cleric and remained loyal to the Church until his death.

Voulgaris also took a keen interest throughout his life in the cause of his compatriots against Ottoman rule. Before moving to Russia, he had translated into Greek the *Nakaz* of Catherine, namely the Instructions to the Legislative Commission, and published it, with the Russian text attached, in St Petersburg in 1771. In his dedication to Catherine, Voulgaris wished that the Greek nation one day might be governed by the same laws as Russia was. During this period Voulgaris wrote and translated other works into Greek (e.g. some philhellenic pieces by Voltaire) hoping to persuade Catherine to liberate his Orthodox brethren. This was in the context of the widely circulating apocalyptic literature of the time. One of his works, published in 1772, contained an assessment of the political situation in the Ottoman empire in the light of the Russo-Ottoman war of 1768–74. There Voulgaris opined that, aside from France which had strong commercial interests in the Levant, all other European nations

could easily undertake a common struggle against the Ottomans. Otherwise, the Ottoman menace would be always imminent for Christian Europe. Probably aware of Catherine's "Greek Project", Voulgaris also followed closely the political developments and the growing role of Russia in Balkan politics. He was particularly thrilled by the treaty of Constantinople (May 1800) between Russia and the Ottomans, which acknowledged the independence of the Ionian islands, including his birthplace Corfu, and by the creation of a "Heptanesian Republic" under Ottoman suzerainty and Russian protection with a moderate constitutional government from 1800 to 1807.

Given the wide range of Voulgaris's activities and interests, it is no wonder that he was regarded as an authority by some of his admirers, a phenomenon comparable to the adoption of Theophilos Corydalleus's Neoaristotelianism a few decades ago. Such a development drew various criticisms from his contemporaries, ranging from the moderate of Moisiodax to the sharp from Athanasios Psalidas, who tried to demonstrate certain drawbacks in Voulgaris's character, teaching methods, archaic Greek style of writing, as well as ideas. These criticisms notwithstanding, it is generally held that Voulgaris's overall contributions to the Greek nation and prodigious output of writings were seminal and almost unparalleled in his time.

W

Wallachia

A principality on the lower Danube that joined Moldavia in 1859 to form the state of Romania

Roughly corresponding to the southern half of Trajan's Dacia, the territory of Wallachia (named after the Vlachs and known to the Byzantine chancellery as Oungrovlachia) lay between the Danube and the Transylvanian Alps. It had enjoyed an indigenous Romanized culture despite being overrun in the 4th to 6th centuries AD by Goths, Huns, Gepids, Avars, and Slavs. When a major part of it was incorporated into the Bulgarian state in the 9th century it came increasingly under largely second-hand Byzantine influence, which persisted sporadically during subsequent invasions by Pechenegs, Cumans, and Tatars. It became a political entity in its own right during the early years of the 14th century through the unification of various small states by Basarab I, who established its independence by defeating his overlord, the Hungarian king Charles I, at the battle of Posada in 1330. With the accession of the Dobrudja it reached its acme under Mircea the Old (1386–1418) despite increasing pressure from the Ottomans, to whom Wallachia was paying tribute by 1391. Although enjoying internal self-government and never becoming an Ottoman *pashalik*, it was forced to recognize Ottoman suzerainty until well into the 19th century (the sultan abandoned his claims as late as 1878), despite the occasional briefly successful attempt to break free.

From its beginning Basarab's state was open to Byzantine influence. This came at first mainly through trade and the Church. Though having first reached the area much earlier, Christianity had been spread by Byzantine missionaries in the mid-10th century, so Wallachia had followed Constantinople rather than Rome in the schism of 1054 and remained firmly Orthodox despite Hungarian pressure. The principal medium of this influence was texts in Old Church Slavonic, the language of both Church and administration until late in the 17th century and the only language of the approximately 2,000 manuscripts known from Romania prior to the 16th century. These texts included translations from Greek of *euchologia* (prayerbooks) and numerous saints' lives and patristic works, and also of secular works, mainly chronicles and legendary tales such as the ever popular *Alexander Romance*. Law was at first largely orally transmitted Roman law, but Byzantine influence was seen here too, most notably in translations of Matthew Blastares's *Syntagma* of 1335 (a legal handbook for clergy that included material from both ecclesiastical and secular sources) and the slightly later compilation of secular laws (*Hexabiblos*) of Constantine Harmenopoulos.

After repeated requests from the Wallachian *voievod* (ruler) Nicolae Alexandru, the ecumenical patriarch in 1359 appointed a metropolitan, Iachint, to the state, a practice that continued until the fall of Constantinople to the Turks in 1453 (the metropolitanate's authority extended to Transylvania, where Hungarian domination allowed Orthodoxy only a tolerated status). Thus encouraged, Wallachian *voivode* both established in their own country many monasteries, which attracted a number of Byzantine monks to administer them, and became patrons of Greek monasteries elsewhere, most notably on Mount Athos, where Alexandru and his son Vladislav completely rebuilt the monastery of Koutloumousiou (whose abbot Chariton later became metropolitan of Wallachia).

Byzantine artistic influence had long been apparent in pottery (in both imports and imitations) and, through Bulgarian intermediaries, in ecclesiastical architecture (e.g. the 11th–12th-century church in the cemetery of Dinogetia), but the reign of Basarab I saw the beginning of much more extensive and closer links. Although his princely church at his first capital, Cîmpulung, was Romanesque, the church of S. Nicolae-Domnească at his new capital, Curtea de Argeş, was not only architecturally dependent upon Byzantine models but contains frescos remarkably similar to those in the narthex of the celebrated church of the Chora (Kariye Djami) in Constantinople. Later in the century Byzantine influence was often more in a Serbian guise (most notably at Cozia) owing to the half-Serbian Athonite monk Nikodemos, who established two monasteries and probably served as the principal conduit into Wallachia of the spiritual movement known as hesychasm which long persisted there.

Under Ottoman vassalage the Wallachian boyars prided themselves upon their Byzantine culture, and after the fall of Constantinople in 1453 they and their Moldavian counterparts, as the ruling class in the only self-governing Orthodox states in southeastern Europe, supported the faith throughout the Balkans: many Greek (especially Athonite), Bulgarian, and Serbian monasteries owed their enhancement and even survival to Wallachian benefactions; influence was exercised even in the

appointment of the ecumenical patriarch (e.g. Niphon II and Pachomios I); and late in the 17th century polemical treatises were published in Greek. Wallachian (and Moldavian) independence naturally attracted Greek churchmen and scholars, who in turn fostered a Byzantine culture in their new homeland (one, Ignatios Petritzis, founded a Graeco-Latin college at Tîrgoviște, the capital in 1646). The Byzantine-Slavonic literature, both religious and secular, also became better known through its translation into Romanian during the 16th and 17th centuries, in the latter of which it received an additional impetus from the establishment of printing presses. Among the enthusiastic promoters of this neo-Byzantine renaissance were the *voivode* Şerban Cantacuzino (1678–88) and Constantin Brâncoveanu (1688–1714), who respectively founded and reorganized at the new capital of Bucharest a Greek academy of such quality that it attracted students from throughout the Greek-speaking world.

From 1714 to 1821 Wallachia was ruled by Phanariot Greeks (or part-Greeks) from Constantinople and members of two families of Hellenized Romanians, who were appointed, dismissed, and often reappointed, like their native predecessors, by the Sublime Porte. The average length of reign for this period was two and a half years, while between 1730 and 1769 Konstantinos Mavrokordatos precariously enjoyed no fewer than six terms in Wallachia and four in Moldavia. Both greed and the need to disburse lavish bribes to gain reappointment ensured that a major preoccupation of their reigns was the amassing of wealth. Since they alone could elevate to the class of boyar, their frequent acceptance of bribes from ambitious members of their accompanying Greek entourage created a strong Greek element among the Wallachian aristocracy. On the other hand, Mavrokordatos weakened their power by granting personal freedom to the serfs in 1746 (although the land was still owned by boyars and monasteries) and limiting to 12 the number of days that they had to work without pay.

Greek language and culture now became dominant for all classes down to the artisanate, as large numbers of Greeks entered the country as both courtiers and merchants. Also, many boyars imitated the Phanariots in having their children educated at home by Greek tutors, who were often priests; and Greek schools were established in provincial centres, although the quality of pedagogy there was frequently very poor. Nevertheless western news, ideas, and culture increasingly penetrated the country, a result of both the importation by traders of Greek newspapers and books printed in Vienna and the Italian education enjoyed by most of the Phanariots, one of whom, Alexandros Ypsilantis, introduced science into the curriculum at the academy in Bucharest. In religious matters, however, the Phanariots continued to be staunch upholders of Orthodoxy and patrons of monasteries both inside and outside the country. The end of their rule came through a conflict of interests in the Greek War of Independence, but Romanians have remained very conscious of their Byzantine Greek inheritance and enjoy a growing presence on Mount Athos, which was revitalized in the 1990s through a reversal of the policy of the communist leader Nicolae Ceauşescu.

Summary

The land between the Danube and the Transylvanian Alps, Wallachia was named after the Vlachs and was known to the Byzantines as Oungrovlachia. Part of the Byzantine Commonwealth from the 9th century, it became an independent state in the 14th century. Though forced to recognize Ottoman suzerainty, it remained a self-governing state until 1859 when it joined Moldavia to form the state of Romania.

Warfare

Antiquity

Civilized warfare on a grand scale in Greece began with the rise of Mycenaean civilization during the 2nd millennium BC. From roughly 1600 to 1250 BC palaces at Mycenae, Pylos, Tiryns, Thebes, and elsewhere fielded well-equipped forces that put a high premium on the use of the horse, chariot, and bow. By the last century of Mycenaean civilization well-protected foot soldiers with spear and sword were fielded in response to seaborne attackers. From the evidence of the Linear B tablets, painted pottery, engraved jewellery, and the physical remains of the vast fortifications of the citadels, the Mycenaean palace armies were probably small, tightly controlled by royal dynasts, and generally inflexible in their response to less well-organized raiders and plunderers, who posed a far greater threat to their stratified societies than did other royal armies in Asia Minor and Egypt. By 1200 BC most of the palaces were destroyed, the population had plummeted, and material culture was impoverished. For the next four centuries Greek warfare of the Dark Ages was probably characterized by the haphazard raiding and skirmishing of mounted grandees accompanied by small bands of attached light-armed foot soldiers.

The rise of the Greek polis – by 700 BC there were probably more than 1,000 city states in the Greek-speaking world – was probably the result of an emerging middling class of adroit and independent small farmers. Their peculiar practice of phalanx warfare was inseparable from their own agrarian chauvinism and political autonomy, and marks the true beginning of western infantry practice. The predominately agrarian character of these citizen militias tended to define hoplite war as a single collision between phalanxes of heavily armed infantry – a decisive engagement in which casualties were limited, victory and defeat clear-cut, and damage to the surrounding countryside and civilian population limited. Such fighting did not require taxation, public investment in war material, or fortifi-

cations, and thus helps to explain the astonishing rise of the Archaic city state itself.

Infantrymen were known as hoplites, due to their cumbersome gear (*hopla*): bronze breastplate, greaves, and helmet; a wooden double-grip concave shield; a spear about 2.7 m long; and a secondary short iron sword. The large shield, more than 7 kg in weight and 90 cm in diameter, also explains the nature of hoplite fighting. The infantryman depended on the man next to him to shield his own unprotected right side and to maintain the cohesion of the entire phalanx, military service now reinforcing the solidarity of the citizenry. The shield's unique double grip allowed its weight to be held by the left arm alone, and its concave shape permitted the rear ranks to rest it on their shoulders as they pushed on ahead. The weight of the panoply – ranging anywhere from 20 to 30 kg – meant that hoplite battle would be short and decisive: infantrymen massed into the columns of the phalanx and charged each other head-on, soldiers seeking cover from the array of shields and victory through the sheer force generated by spearmen pushing against the backs and sides of their friends and family ahead. On flat ground, hoplites in formation were usually invulnerable to mounted assault by the more wealthy and the harassment of poorer skirmishers.

Generals fought in the front rank and their tactical options were exhausted with the prebattle placement of particular contingents along the battle line and the choice of terrain. Before the 6th century BC fleets were rare and sea battles essentially non-existent. Armies were challenged to fight by formal notification and occasionally coerced to action by the ravaging of local crops. Battle itself was not much longer than a half-hour or so; pursuit was haphazard. The Persian (490–479 BC) and Peloponnesian (431–404 BC) wars changed all that, and revealed the tactical limitations of hoplite armies when faced with forces that did not share the same protocols of warfare and fought in theatres and on terrain far removed from flat plains. During the 5th century BC Athens turned to its fleet and soon developed sophisticated methods of defensive and offensive naval manoeuvres, attacking through or around an enemy line of ships to achieve easy ramming. In contrast, the Spartans sought to improve on the simple collision of hoplite battle by mastering outflanking movements on the right wing, made possible by the superior drill and training of their professional corps. Thucydides' magnificent description of Mantinea (418 BC) reveals how such tactical competence might shatter an enemy line and change the entire course of battle. At the battle of Delium (424 BC) the Theban general Pagondas first employed reserves, massed phalanxes deeper than the standard eight shields, and used horsemen for more than just preliminary skirmishing. Cleon, Brasidas, and Demosthenes during the Archidamian War (431–421 BC) experimented with light-armed troops to attack hoplites, through manipulation of terrain, darkness, and sheer surprise. No-one sought decisive confrontation through traditional hoplite pitched battles, since warfare was now beginning to be governed more by military necessity than by cultural restraint.

Epaminondas the Theban (d. 362 BC) is often considered the father of Greek infantry tactics. In fact, none of his "discoveries" – a deepened phalanx, the use of superior troops on the left, the oblique order of march, the incorporation of elite units, and the combined use of horsemen – was novel per se. Rather his originality lay in combining these previously known tactical options into a unified battle plan – one uniquely suited for his phalanx of dour Theban agrarians who had a reputation in antiquity for physical prowess and infantry ferocity. Epaminondas' victories at Leuctra (371 BC) and second Mantinea (362 BC) proved that an innovative heavy infantry might alone still clear a battlefield of the enemy. Yet, his grand invasion of Laconia (370–369 BC) that freed the Messenian helots did more to emasculate Sparta than did his defeats of Spartan hoplites in pitched battles, proving that victory now required the use of infantry as part of larger economic and cultural strategies. More abstract 4th-century BC reactionaries also sought to maintain infantry superiority through more innovative use. Plato and Aristotle, for example, speculated on novel ways of preserving the noble tradition of hoplite supremacy within the city state; their advice ranged from the employment of infantry in expanded roles on the borders to the incorporation of stockades and fortifications within the old civic idea of a hoplite militia defence.

Nevertheless, throughout the 4th century BC most generals worried less about the tactical possibilities of infantry employment than learning the new uses of artillery, missile troops, peltasts, and cavalry, both for the attack on and defence of fortified positions. The more utilitarian philosophers and rhetoricians of the 4th century BC reflect this growing tactical renaissance, as they sought to apply dialectic and induction to generalship (*strategika*), the arrangement of troops (*taktika*), and weapons training (*hoplomachia*). War was no more a question of bravery or a reflection of values, but simply an art (*techne*), teachable like any other. Xenophon (428–354 BC), as author of monographs such as *The Cavalry Commander* and *On Horsemanship*, is the best example of this mixture of battlefield experience and philosophical training. His contemporary, the pragmatic Aeneas the Tactician, follows in the same utilitarian tradition. Aeneas' apparently vast *Military Preparations* is lost, but an extant monograph about survival under siege covers everything from the mundane (e.g. passwords, reveille, codes, tunnelling, fire-signals) to the broader employment of mercenaries, sorties, and plans of evacuation.

Philip II (359–336 BC) and his son Alexander III (336–323 BC) of Macedon sought to combine infantry innovation with light-armed, missile, and mounted troops to form a true symphony of forces. Battle became longer, as much as several hours in duration. The general – nearly always mounted – now had a host of options and different troops at his command, which allowed the much smaller Macedonian armies to create havoc at particular spots in the enemy's battle line, through which poured heavy cavalry and infantry, causing psychological terror and general collapse – as the Greek confederates learned at Chaeronea (338 BC), the last battle by truly independent city states. Perhaps Alexander's greatest tactical contribution was the idea of rapid and unceasing pursuit, as part of his overall aim of destroying the enemy outright on the battlefield. Heretofore, battle tactics had not been closely integrated with larger strategic issues. But Alexander saw troop arrangement as merely a part of grand strategy – his aim was not only to win on the battlefield, but to destroy both materially and spiritually the enemy's will to resist. Infantry battle would then logically lead to the invaded surrendering its territory and very culture to Macedonian royal control.

In that regard, Alexander entirely reinvented the notion of Greek tactics, which in the 4th century BC had evolved from, but not replaced, the original emphasis on formal infantry engagements to resolve border disputes. The original purpose of Greek battle had been to limit casualties and resolve disagreement through the simple and often economic use of force. With the decline of the agrarian city state in the 4th century BC, however, the Greeks enhanced decisive battle with auxiliary troops to make fighting longer and more elaborate – but not necessarily all-destructive. Under the Macedonians the West at last applied its full scientific and rational arsenal to the battlefield, as part of a larger effort to destroy a culture, rather than to defeat an enemy. Tactics at last now fully served strategy and Hellenic warfare became the most lethal in the history of civilization up to that time.

During the subsequent Hellenistic era (323–146 BC) Greek-speaking mercenaries were prized throughout the Mediterranean as pike-carrying phalangites that could rout indigenous tribal armies and alone stand up to the Roman legions. Pikes lengthened to nearly 6 m in length and were wielded by both hands, as body armour and the shield shrank or disappeared altogether – the safety of Greek mercenaries' lives was now less important than their ability to kill. After the failure of Pyrhhus in Italy (280–279 BC), the Greeks spent a century and a half resisting Roman invasions. Some of the great battles of the age – Cynoscephalae (197 BC) and Pydna (168 BC) – pitted Greek hired infantry on Greek soil against republican legionaries. But the inflexibility of Greek tactics, the cumbersome nature of the Macedonian phalanx, the greater manpower reserves of Italy, and the superior élan of agrarian Italian recruits led to the doom of the Greek-speaking armies. With the final subjugation of Corinth (146 BC) Greek military forces per se ceased to exist and the phalanx became the curiosity of pedantic armchair strategists. In some sense, Roman republican militias with their emphasis on group solidarity, patriotism, and belief in a superior culture had become more Greek than the Hellenistic dynastic armies they conquered. The forces of Alexander's successors were every bit as despotic, top heavy, and corrupt as the old Persian imperial levies, whom the Greeks had conquered almost two centuries earlier.

Under the Roman empire Greece suffered from high taxation and general depopulation, ensuring that organized military rebellion was out of the question. Most Greek soldiers fought anonymously as hired soldiers in the legions on the northern and eastern frontiers of the empire. Yet except for a few horrific battles between rival Roman dynasts, Roman control brought Greece a half-millennium of general tranquillity (100 BC–AD 400) – the longest period free of major wars in Hellenic history. With the collapse of the western empire, Byzantine armies took over the exclusive protection of Greece. For the first time since the 2nd century BC, there were now to be independent Greek-speaking armies in Italy, North Africa, and Asia Minor. Under Justinian's skilled generals Narses (478–573) and Belisarius (500–65), Greek soldiers ranged from Italy to Persia, trying in vain to reconsolidate the western empire under the aegis of Hellenism and Orthodoxy. Sound tactics and the Byzantines' technological edge in shipbuilding, fortifications, and armament compensated for a general absence of manpower and hardy rural infantry. Still, small mobile Greek armies would keep foreigners out of Greece until the arrival of the Franks in the 13th century. The ancient and modern history of Greek warfare is characterized by remarkable success when local, highly motivated militias are used for defence, but eventual failure when Hellenic armies are sent far overseas without adequate material and spiritual support from home.

Byzantium

Peace was not the expected norm for the Byzantines, who inherited traditions of planning and practising warfare from their ancient and Hellenistic predecessors and from the Romans, although usually reported through the medium of the later Greek military writers. Yet the Byzantines were not primarily a warlike people nor was Byzantium a martial state, even though it inherited and adapted some Roman traditions. Caution, resort to cunning, and confidence in the value of mental expedients to compensate for the lack of numbers were vital features of Byzantine military strategy. Byzantine military manuals owe much to Hellenistic models, such as the 1st-century AD treatise of Onasander. In the early Byzantine period some generals found advantage in using or adapting ancient and Hellenistic Greek battle formations to their own situations. A close examination of the historical narratives indicates that such exercises were not merely theoretical, but were occasionally used in reality.

There are many gaps in the sources. Byzantine historical narratives about warfare seldom provide detailed reports on combat, except for some stereotypical flourishes about the feats of arms of a few prominent individuals. Military manuals provide some of the best information concerning battle,

Warfare (Byzantium): illustration from the 11th-century chronicle of Skylitzes showing troops of Basil I (right) fleeing from the Arab army, late 9th century, Biblioteca Nacional, Madrid

manoeuvre, and logistics, but they are abstract. Speeches, letters, and other literary works are usually unhelpful on the subject of battles and campaigns. Autobiographical reminiscences are rare in themselves and seldom useful. There are no memoirs or other autobiographical accounts by Byzantine warriors, whether at the top of the military hierarchy or in the ranks. These omissions limit our understanding of warfare and soldiers' experiences of it. Archaeology provides some evidence concerning arms and armour, and occasionally on topography and the appreciation of its contribution, but it cannot resolve many serious questions about actual battles or campaigns. Representations of combat and military dress in illuminated manuscripts and frescos may appear to be important but they are problematic, because they may depend on non-contemporary prototypes and models.

Opponents of the Byzantines, both western European and Muslim, have left important narrative accounts of their military encounters. These external accounts are valuable for the 10th century and later, and especially for the 12th century and beyond. Warfare changed measurably during this long period. In the early Byzantine periods, the armies fought in different kinds of terrain and were subject to the vagaries of very different climates.

Whenever possible, irrespective of period, Byzantine strategists preferred to avoid pitched battles and their attendant risks of human and material losses, and instead to resort to their intellect. Because human and material resources were limited, they tended to try to avoid risking what they had. The Byzantines seldom enjoyed numerical superiority in the field. Instead, they often sought to destabilize their opponents through assassination, diplomacy, delay, craft, deception, and the exploitation of internal divisions, to cause them to desert, switch sides, or flee. They tried to take advantage of the impetuousness, recklessness, and thoughtless greed of their opponents. They sought to gain intelligence about their opponents through any possible means and they developed reference works about the weaknesses and strengths of the fighting techniques and practices of various contemporary ethnic groups. They sought to adjust warfare to the practices of their foes, whose psychological vulnerabilities they tried to exploit. This prudent avoidance of gambling everything on the outcome of a single battle or campaign contributed to the longevity of the empire, although it did result in some humiliating and serious territorial losses, and ultimately there were situations in which there was no choice but war. The Byzantines became overconfident in their ability to use intelligence instead of raw power to prevail, and there were occasions in which superior power determined the outcome.

More difficult to trace but nonetheless valuable was another Byzantine inheritance from ancient Greek and Hellenistic practices: the passing down and modification of lore from the Balkans and from Anatolia about fortifying and exploiting mountain passes in warfare. Mountain passes could permit small forces to check or destroy much larger numbers of opponents. Techniques for trapping raiders reached their perfection in the early 10th century. The Byzantines developed techniques for observing, tracking, trapping, and destroying the Arab raiders who penetrated on to the Anatolian plateau, especially between the mid-7th and 10th centuries. These techniques may have originated in unrecorded practices of guarding and using mountain passes in earlier warfare against the Persians, and to some extent they may even have derived from lessons learned in defending rough terrain and passes in Byzantine Africa against Berber raiders.

Byzantium had no military academy. Soldiers learned by apprenticeship, direct and third-party experience, and for a few of the elite, by reading military manuals from the larger corpus of military literature. Likewise there was no general staff in some centralized location. Although Constantinople was the nerve centre for the reception and filtering of military and political intelligence, given the slowness of communications, many important decisions had to be made by comman-

ders on the spot, especially in the early and middle periods when the empire's perimeters were vast and conditions poor on many of the routes. Local situations could not be micromanaged from faraway Constantinople; local commanders therefore enjoyed considerable discretion.

Civilians and the ecclesiastical hierarchies probably had little accurate understanding of the realities of warfare, so that although popular support and input might be valuable at times, it was rarely useful. No great effort was made to bridge this gap, apart from some late theoretical treatises, such as a memorandum of George Gemistos Plethon. Morale-building was important to the Byzantines. What has been called a liturgy of war had already appeared by the 6th century. Exhortation to Christian as opposed to ethnic solidarity was fundamental in some cases of Byzantine combat. However the efforts by such emperors as Nikephoros II Phokas (963–69) to obtain patriarchal approval for promises of salvation for those who died in combat failed; concepts of holy war were alien to the Byzantines.

Success in warfare met with both appreciation and fear. Victorious commanders might win popular adulation but they might also become objects of fear and envy – fear (especially on the part of emperors and their bureaucratic counsellors) that they might attempt to seize power for themselves. Because of their perpetual fear that generals might be tempted to revolt and covet the imperial throne for themselves, the officials of the imperial government often sought to deny them large amounts of funds and supplies and discretion and imposed rigid bureaucratic controls.

The Byzantines relied on both horse and foot. Field armies seldom exceeded 15,000 or 20,000 men, and were usually smaller. Although cavalry may have been dominant, infantry was important in many actions. Archery, especially mounted archery, gave the Byzantines an asymmetrical advantage over some Germanic opponents in the 6th-century reconquests of the era of Justinian I (527–65). Heavily armoured horse became predominant by the late 10th century. Throughout their history the Byzantines made extensive use of a combination of naval and land forces. Their extensive coastlines and islands and their maritime heritage made the naval dimension an important one in their ability to wage war. Siegecraft was a particular speciality of the Byzantines, and owed much to its Hellenistic and Roman heritage.

The zenith of Byzantine skills in actual combat, as opposed to the containment and destruction of Muslim raiders, may well have occurred in the late 10th century, contemporary with and an essential ingredient of the Byzantine reconquest of eastern Anatolian and north Syrian territories from the Muslims. This was the era of heavily armoured (cataphract) Byzantine cavalry, armoured themselves as well as their mounts, and also the era in which Byzantine expertise in shock in mounted combat peaked. One difficult aspect of such combat, as in earlier Roman and Byzantine warfare, was the coordination of horse and foot: hollow squares might be formed from which horse would sally and foot would open and then close ranks. It was easy for such formations to make mistakes that led to costly losses in men and beasts.

In the early centuries the Byzantines drew on a vast repertory of ancient and contemporary military experience from many regions, climates, and ethnic groups. They adapted manoeuvres, weapons, and techniques from the best of the array of contemporary friends and foes. What might be effective in the Balkans might be impractical in North Africa or Syria. The Byzantine Balkans, with their marshes, mountains, and severe winters and greater precipitation than Asia, offered challenges and opportunities. Booty, including prisoners, was an important aspect of warfare. Exchanges of prisoners took place from time to time. Noncombatant casualties were high, and although some effort was made to evacuate the wounded, losses from wounds were probably very high throughout Byzantine history.

Byzantine armies were not homogeneously Hellenic, for at all periods of the empire there were substantial numbers of non-Greeks serving in the armies. Latin remained the language of command until the end of the 6th century, but presumably it gave way permanently to Greek in the 7th. The core of the officers who dominated the Byzantine army and organization of warfare were of mixed Greek-Armenian background and, between the 6th and 11th centuries, largely from Anatolia. Belisarius (died *c.*AD 565?) was the greatest master of Byzantine warfare, for he waged war competently and successfully against the Persians in western Asia, in North Africa against the Vandals, and in Italy against the Goths.

The greatest Byzantine innovation in warfare was the invention and use of Greek fire, an igneous petroleum mixture, which is first attested in the late 7th century, although it may owe something to traditions of Hellenistic techniques. Eventually, most notably by the time of the Crusades, other peoples learned and mastered these techniques. Fortification and siegecraft consumed many financial resources as well as much mental effort. Special attention was given to problems of selecting, creating, and securing camps, a process that owed much to adaptations from earlier Roman traditions. In principle, conforming to Roman tradition, emperors ideally were soldier-emperors and leaders in war. The reality was often different.

The Byzantines relied heavily on the gathering of intelligence to aid their military and tactical decision-making and performance in warfare. They developed skills in fighting against diverse peoples in diverse terrain and weather. They made use of climate (darkness, cold weather) in fighting certain peoples. Expeditions into enemy territory involved different problems from arranging local defences against raids. Elaborate preparations were necessary for expeditions. Some extant treatises describe expeditions that included the emperor, which were, of course, very special cases.

By the middle of the 11th century the Byzantines began to lose their superiority in expertise in warfare. Innovation in technology, weapons, tactics, and in military theory took place outside the borders of the empire, which henceforth had to hire external specialists. Norman men at arms in the west and Turkic horsemen in the east simultaneously proved superior in combat by 1100. The reasons for this loss of initiative and innovation are unclear. Resort to diplomacy became even more important than before. The Byzantines drew heavily on Turkish and western manpower and specialized foreign skills in warfare in the 11th to the 15th centuries. They failed to internalize either the gunpowder revolution or newer techniques of drilling and deploying infantry that were emerging in Europe and in the Levant in the 14th and 15th centuries, such

as training infantry to develop cohesive formations using the pike. This helps to explain the increasing Byzantine dependence on foreign mercenaries, although soldiers of foreign origin existed in every century of Byzantine history. Their specialized skills were valued. But mercenaries were an expensive option for the fisc and also brought in their wake political costs, for they were unpopular with many of the empire's subjects, including significant parts of the elite.

Traditions of Byzantine warfare became an important and lasting Hellenic legacy to early modern military thought, that is, in continental Europe in the 17th and 18th centuries. Even the modern term "strategy" derives from a late-18th-century inspiration from a Byzantine military treatise, the *Strategikon* of Maurice. That treatise, as well as the *Tactica* of Emperor Leo VI the Wise and some writings of emperor Nikephoros II Phokas, marked the apogee of Byzantine military writing. It is unclear to what extent later estradiots (light cavalry), who were prominent in early modern warfare of the late 15th and 16th centuries, consciously inherited and perpetuated Byzantine traditions.

Water management

Use and distribution of water

Whenever more than a handful of human beings settle permanently in one spot the availability of water becomes one of the parameters that determines their survival. Water for drinking must be reliable and potable. Water for crops must be available at the right time and in the right quantities. For the Greeks, the availability of water is itself largely determined by the Mediterranean climatic regime and the limestone-dominated geology of Greece, which allows for the formation of many subterranean sinkholes and channels.

Perpetual streams and springs are rare, with even major rivers shrinking to trickles or dry stream beds in the summer, only to become rushing torrents when the winter rains arrive. Across the millennia the Greek farmer needed to be opportunistic with regard to the use of water. Along with wells, cisterns for catching and storing rainwater are a regular feature of ancient houses, whether they stand in town or in the country. Terracing of fields is also a product of the rainfall regime of the Mediterranean climate; it simultaneously prevents erosion and ensures that more water saturates the agricultural land. Cereals must go into the ground in the winter to take advantage of the period of maximum moisture and be harvested at the beginning of the summer. Grapes, on the other hand, need the long dry weeks to ripen and become sweet. After picking, fruit that the farmer intends to dry for raisins can safely be left to bake in the open under the sun. The chances that sudden rain will ruin the harvest are slim.

The Aegean cultures were not like the "hydraulic civilizations" of Mesopotamia and Egypt which depended on the construction and coordination of a vast network of irrigation canals and dykes. Water management, whether rural or urban, tends to be small-scale and locally controlled. A simile from Homer's *Iliad* (21. 257–59) gives a vivid picture of the typical irrigation technology of ancient and medieval Greece:

> as a man running a channel from a spring of dark water
> guides the run of the water among his plants and his gardens
> with a mattock in his hand and knocks down the blocks in the channel...

An important exception to this rule can be observed through the history of Lake Copais in Boeotia. Historically, it was more of a swamp than a continuous expanse of water, waxing and waning with the seasons. The ancient Greeks believed that the Minyans, a legendary people of the heroic age, had drained the water and turned it into arable land. When drainage operations were begun in the late 19th century, the truth behind the tradition was revealed. The lake had been drained in Mycenaean times by a series of canals and earthen dykes, reinforced by Cyclopaean masonry, which conveyed the water to natural fissures in the earth. Perhaps this work was overseen by the rulers of the citadel of Gla which overlooks the Copaic plain. There were attempts at drainage in classical and Roman times, but none was carried through to completion. Even the modern efforts were not completed until well into the 20th century.

If the Mycenaean rulers were capable of envisioning and carrying out the draining of the Copaic basin, it should not be surprising to find that they had a sophisticated infrastructure for providing for the water needs of the palaces and surrounding settlements. Large populations living in close quarters had to be provided with drinking and washing water, while waste water and sewage had to be drained away from areas of habitation. In this technology, as in so many other things, they borrowed heavily from their Minoan predecessors.

Given the high level of luxury and elegance in the palace of Knossos, it should come as no surprise that much care and ingenuity were devoted to the area of personal hygiene. This is seen most strikingly in the suite of rooms known as the Queen's Megaron. Besides the bathroom proper, furnished with a soaking tub, there was a separate chamber with an elaborate system of interconnected cisterns, drains, and sewers. This running water was apparently used for a lavatory and, perhaps, a shower (Pendlebury, 1933, p. 52). At one of the outbuildings of the palace complex, dubbed the Caravanserai, there were provisions for travellers to wash their feet and bathe in tubs filled with water heated by wood fires. Even at this level

of society, however, water was not wasted: the water from the footbath flowed out into a drinking trough for animals.

Mycenaean palaces and towns have produced evidence of aqueducts and public drainage systems. The most impressive Mycenaean water projects date from the late 13th century BC. This was a time of increased fortification at major citadels such as Mycenae and Tiryns. If, as seems likely, the rulers of these towns felt the need to prepare to face external threats, their efforts to secure the water supply can be seen as part of that preparation. At Athens, Tiryns, and Mycenae tunnels or passages were opened to secret springs, so that they could be reached even in the event that the city walls were besieged. Despite all these precautions, the Mycenaean civilization collapsed in the 12th century BC. With the administrative structure of the palaces gone, the Mycenaean drains and aqueducts fell into disrepair.

The depopulation and devolution of the Dark Ages saw the loss of many of the technological achievements of the preceding centuries. Although people may have been aware of the principles behind the construction of systems for water transport and drainage, there seems to have been little incentive and/or logistical support for carrying out such projects. This situation changed in the Archaic period when many Greek cities were ruled by tyrants. Dependent on popular support in their conflicts with aristocratic factions, these despots often undertook major public works projects for the improvement of their cities. In the late 6th century BC Polycrates, the tyrant of Samos, was responsible for what Herodotus would later call three of the greatest feats of building and engineering in the Greek world: the great temple of Hera, the island's artificial harbour and breakwater, and a tunnel driven straight through a mountain to bring water to the city.

This tunnel, called the tunnel of Eupalinus after its architect, was inspired by the same desire that we saw in the Mycenaean citadels: to provide the city with a hidden and secure water source in times of siege. What sets Eupalinus' achievement apart is that he drove his tunnel straight through a mountain for approximately 1 km. Even then the water had to be brought from its source more than 800 m away through an underground conduit. Water did not flow through the tunnel itself, but through a covered conduit that ran below the level of the tunnel floor and at a steeper gradient. It is not known whether this secondary excavation was part of the original plan or was added when it became clear that the slope of the tunnel was inadequate to maintain the flow of water. How exactly the line of the tunnel was laid out and followed with such remarkable accuracy by the workmen is another mystery (Goodfield, 1964).

Although none of the other tyrants attempted anything so grandiose, many of the famous fountain houses of antiquity had their first architectural elaboration in the 7th and 6th centuries BC. For the ancient Greeks, even natural springs had an aura of sanctity about them because of their importance and rarity. Obviously a settlement could not be contemplated where there was no source of water, but the built-up area might be some distance from the spring itself, perhaps because of concerns about contamination. Transporting the water to a more convenient location became an objective. Pisistratus of Athens, for example, laid an aqueduct that ran into the Agora, as well as building Athens' famous nine-spouted fountain called Enneakrounos. The location of this fountain is still uncertain, although a contemporary fountain house was found in the southeast corner of the Agora.

Archaic and Classical fountain houses tended to be relatively simple. The first modifications to the natural spring might be simply to carve out a basin or storage cisterns from the surrounding rock. After that came the roofing over of the cisterns, and then the construction of a columnar porch under which the people drawing water might stand. Other amenities might be a parapet on which to rest one's jar, or a spout to fill it. Fountain houses, along with government buildings, a theatre, an agora, etc. were among the marks of a polis, according to Pausanias. This public supply of water had several advantages over what might be available in private homes. Well water, though fresh, was difficult to draw up and might disappear in times of drought. Runoff water was collected and stored in underground cisterns, but was used for purposes other than drinking if at all possible. By bringing water from the fountains, women (and it was almost always women who performed this task) got better-quality drinking water as well as a chance to meet friends. Many depictions on vases make it clear that going to the fountain house was a time for socializing.

Classical cities, by the end of the 6th century BC, also had provisions for draining away storm and waste water. These sewers ran in large channels through public open spaces and in smaller pipes beneath the streets of residential areas. Private houses were equipped with a small room holding a drain leading into the sewer lines. By the 4th and 3rd centuries BC, Greek latrines progressed to wooden benches or terracotta seats. Bath tubs were still free-standing containers without drainage holes, so drawing and emptying a bath must have been tedious work. Public baths had individual tubs which in some cases were filled by running water from a channel that ran by them at shoulder height. These baths were connected with gymnasia or shrines of Asclepius and thus generally for the use of men only (Crouch, 1993, pp. 26–29).

Aqueducts, fountains, and baths from the Roman period show a much higher degree of elaboration than earlier structures. Roman rule brought an end to endemic warfare, so it was possible to run above-ground aqueducts for great distances without fear of exposure to enemy forces. Large public baths open to both sexes are a prominent feature of Roman urbanism throughout the provinces. During this period fountains become nymphaea – ornate, usually multistorey constructions which were only secondarily places to get water. With their sculptural decoration, multiple fountains and pools, and rich materials they existed mostly as a stage for the display of the interplay of light, water, and stone which is such a hallmark of the architecture of the empire at its height.

As conditions deteriorated in the empire, bringing water to cities and towns over long distances became more problematic. Constantinople was largely dependent for water on an aqueduct originally built by Hadrian and restored by Valens in the 4th century AD. More aqueducts were constructed around this time, but both the capital and provincial towns became increasingly dependent on cisterns. This was especially true after the wave of destructions in the 7th century when many aqueducts were destroyed and never replaced. Urban need for water may in fact have been less in the 7th century, since by

this time most of the large public baths had fallen into disuse. Declining population and rising maintenance costs were no doubt a factor in this decline, but there was also a change in attitude towards the public baths. Attendance at the baths was no longer considered part of one's daily routine but a rare luxury, or something undertaken as part of a medicinal regimen. Monasteries, on the other hand, constructed baths that were specifically associated with healing throughout the Byzantine period. During this time there was an increase in the use of water, instead of oxen, to power mills. Remains of several examples from the late 5th century AD, along with the aqueduct that brought water to them, are preserved in the Athenian Agora.

Changes in Greece's economy and society since the late 19th century have raised a whole new set of problems connected with water. The reorientation of the agricultural sector towards the commercial exports of crops such as citrus, tobacco, and cotton which require extensive irrigation has led to a depletion of groundwater and the salinization of farmland that often accompanies irrigation. The generation of hydroelectric power has resulted in the draining of many lakes. Greece's population is inadequately served by waste-water treatment plants, with the result that industrial wastes and untreated sewage have rendered the inner Saronic Gulf almost lifeless in recent years (Curtis, 1995, p. 106). Water management is a subject that will loom large in planning for future development in Greece.

Women

There is little certain information about women in Bronze Age Greece and Crete so that most of our knowledge of them during this period is speculative. The two main sources of information are art and the Linear B tablets.

While feminine figures play an important role in both Minoan and Mycenaean art, their identity is not clear. They may be goddesses, priestesses, nobility, or common women. It appears that in many instances females portrayed in Bronze Age Aegean art are goddesses. Feminine statues are shown adorned with snakes, birds, or floral motifs, often with arms upraised in a possible pose of prayer or benediction (the "Goddess with Upraised Arms"). One small ivory figurine from Mycenae shows two women seated together with a small child on the lap of one of them. Some scholars have interpreted this as an early portrayal of Demeter, Persephone, and Plutus. In glyptic art, especially from Crete, females are shown in the centre of outdoor religious scenes, often engaged in dances. Women were represented in the frescos that adorned houses and palaces. In some instances they are depicted gathering crocuses in idyllic scenery, while in others they are shown socializing in the company of men. In Crete they participate in scenes of ritual procession, while one fresco from Mycenae shows two females together driving a chariot.

Linear B texts, while fragmentary and of a "shopping list" nature, give clearer glimpses into the everyday lives of women: they appear as queens (*wanassa*), priestesses (*hiera*), landowners, temple servants, and slaves. While only the surface of the roles of women in Linear B has been scratched, it appears that on the Greek mainland a patriarchal system was already in place. Among women, only religious functionaries owned land. Conversely, texts from Knossos in Crete show women owning fruit orchards independently of men, possibly indicating their higher status in the wake of the Minoan civilization. In both regions female slaves were common, usually identified by a proper name and the land of origin. This may be indicative of the seizure of women as war booty as portrayed in Homer's *Iliad*.

Beginning with Homer and Hesiod, literary and historical texts and art provide information concerning the lives of women in the historical period. Unfortunately, most of these texts and images were rendered by men, and thus they offer a view of women from the male perspective. While women had extremely limited political and economic powers, they played active roles in the cultural life of ancient Greece. Prominent literary names that have survived are of the poets Sappho of Lesbos (6th century BC) and Telesilla of Argos (5th century BC).

Women were most active in the religious life of the polis. The two most important fertility rites, the Thesmophoria and

the Skirophoria, were administered solely by women. Since the former was a three-day-long affair involving all Greek women (except virgins – Callimachus, fr. 63), it is evident that considerable planning was involved, all controlled by women. In Aristophanes' *Lysistrata* (640ff.) the chorus of women recounts bearing the basket in the Arrhephoria, milling flour for the Athenaion festival, "playing the bear" for Artemis at Brauron, and serving as basket-bearers in the Athenaion festival. While such roles were often reserved exclusively for the upper classes, other important religious positions were not. The priestess of Athena Nike on the Athenian Acropolis was chosen by lot from the female population of Athens. For her services she received an annual salary of 50 drachmas and the hides and legs from the public sacrifices. On the more human side of religion, literature and art show that it was women who were responsible for the care and remembrance of the dead. Women prepared corpses for burial, were the chief mourners during funeral processions, and brought offerings of garlands and funerary libations to the dead after burial (*Choephori*).

Beyond religious duties, women's lives consisted of marriage and motherhood, textiles, and household management. The clearest picture of household life comes from Xenophon's *Oeconomicus* and Lysias' *Murder of Eratosthenes*. Combining the two, a picture of married life emerges. The woman is married very young to an older husband chosen by her parents. Once married, she cares for the organization of the household, spinning and weaving, and, in the case of more affluent brides, supervises the household slaves. Women wore lead cosmetics to make themselves appear pale, the ideal shade for those expected to remain indoors. They travelled outside the house for religious events, funerals, and to meet neighbours. These forays outside the home were viewed with suspicion by men, who were apparently in chronic fear of adultery (*Eccleseazusae*). Lower-class women also worked outside the home (Demosthenes, 57. 31–35; *Thesmophoriazusae*, 446–52). Between the "respectable" and working classes were the *hetairai* (courtesans), the most famous of whom were Aspasia, Neaira, and Lais.

From the end of the 5th century BC into the 4th, women's lives became increasingly constricted. Pericles claimed that the best that could be said of any woman was that her name was never mentioned in public either for praise or blame (Thucydides, 2. 45). In the 4th century BC gynaecology, and thus women's bodies, fell increasingly into the hands of male doctors, while philosophers such as Plato ascribed the roles of midwife and mother to males and their progeny of the mind.

In the Hellenic period, while many general aspects of life such as religion and motherhood remained the same, women of all classes made greater contributions to politics, culture, and society than previously, and women experienced greater freedoms than at the end of the Classical period. In the aristocracy, women ruled as queens, either side by side with their consorts or independently. Notable at the head of dynasties were Olympias, queen of Macedon and Alexander's mother; Berenice II (3rd century BC), queen of Cyrene and Egypt; queen Arsinoë of Egypt (*c.*270 BC); and Cleopatra VII (1st century BC), queen of Egypt and final monarch of the Hellenistic dynasties.

Nonroyal women also enjoyed social, legal, and economic benefits in the Hellenistic age. In the 2nd century BC a woman called Archippe was publicly honoured in Cyme (Asia Minor) for financial contributions made to the polis (Pleket, no. 3), while an inscription from Histria records the existence of a female archon (ibid., no. 2). In the 1st century BC Phile of Priene held the office of *stephanephoros* ("garland bearer") for building, at personal expense, the city aqueduct and reservoir (*Inschriften von Priene*, 208). Economic independence, if not wealth, was possible for lower-class women. Documents preserved from Egypt reveal: a marriage contract sworn between Heraclides and Demetria to regulate their claims to property and means of redress in case of violation (*P. Elephantine*, 1); a lawsuit enacted by Philista, "a working woman", in a case of personal injury (*P. Enteuxis*, 82); and the complaint of one father whose daughter Nike was expected to support him financially through her labour (ibid. 26).

In the cultural sphere, this was the age of the female intelligentsia. Poets such as Erinna (4th century BC) and Nossis (3rd century BC) were likened to Sappho (Antipater, 9. 26), while Aristodama of Smyrna was made *proxenos* ("patroness"), citizen, and benefactor of Lamia for her verses (W. Dittenberger, *Sylloge Inscriptionum Graecarum*, 1915–24, 3. 532). Anyte of Tegea, among other works, wrote epigrams for dead maidens, noting their wisdom as well as their beauty (*Anthologia Palatina*, 7). Some women became painters, with Laia of Cyzicus renowned as the finest portrait painter of her day (Pliny, *Naturalis Historia*, 35. 147ff.). In philosophy, women studied at Plato's Academy (Diogenes Laertius, 3. 46, 4. 2, 6. 96ff.), while in the 4th century BC women began formal practice of medicine (Hyginus, *Fabula*, 274. 10–11).

Like the Hellenistic age, the Byzantine period is punctuated by prominent women in politics and the intelligentsia. Earlier female aristocrats, such as St Helena and Pulcheria, functioned mainly through the offices of their male relatives (the emperors Constantine I and Theodosius II respectively). Empress Theodora (*c.*497–548), wife of Justinian, was the first woman co-autocrat of Byzantium, with her own functions within government and the power to legislate reforms. Many of these reforms benefited women, such as an edict of 535, interdicting procurement and brothels in all major cities of the empire. At the pinnacles of female political power were empress Irene (fl. 800), and Anna Dalassene (fl.1090). The former, having blinded her son and rival to the throne, ruled as sole autocrat of Byzantium, prompting the coronation of Charlemagne in the West. Dalassene was chief adviser to her son, emperor Alexios I Komnenos (1081–1118), and she ruled Byzantium with full administrative powers when her son was on campaign.

Female intellectuals were rare but significant. The most famous is Hypatia of Alexandria (*c.*AD 370–415), scientist, mathematician, and Neoplatonic philosopher. In the 12th century lived Anna Komnene, the only female historian of the Byzantine era, who wrote the *Alexiad*, her father's biography.

The Church Fathers of the now Christian empire proclaimed that women were inferior and weak; even sins acquired feminine personifications (Neophytos Enkleistos). Thus women were barred from priestly functions and teaching. The ideal role of woman was, of course, wife and mother, with this latter occupation receiving high praise in panegyrics from

such notables as Theodore of Stoudios and Psellos. While virginity was considered a high virtue, its inappropriate loss was not as severely punished as in the days of Solon; a girl who lost her virginity to a man other than her betrothed could simply be repudiated by the bridegroom (Leo VI, *novels* 93).

Women wielded considerable economic power at all levels of society for which data exist. From the days of Theodora, sisters shared equal inheritance rights with brothers, and widows kept full control of their dowries. From the 11th century at least a significant portion of legal cases concerned women's control of their property (Laiou, 1992, vol. 1, p. 239). Abbesses who wrote typika (or rules) for their monasteries had full economic powers and deliberative control (ibid p. 242). As for employment, although women were expected to work only in textiles, it is evident that they were occupied in other fields. One typikon of the Pantokrator monastery in Constantinople refers to female doctors and nurses (ibid, p. 245), while the 14th-century traveller Ibn Battuta wrote that most artisans and merchants in the Constantinople bazaar were women.

In most respects, Greek women's lives today differ little from those of other western women. They have the right to education, property, and equal representation in law. Specifics of life, as always, are determined by class and region of habitation. The lives of upper-class women and villagers are more restricted before marriage than those of the lower classes and urban residents. A "proper" upper-class young woman travels with a chaperone until she is married. After marriage, and especially after divorce, however, these women are free to travel and spend their time as they will. While divorce is a more difficult matter for less affluent rural denizens, marriage does nevertheless allow a new freedom for women. Even adultery may be acceptable should the husband not be present for extensive periods of time (Loizos and Papataxiarchis, 1991, p. 229).

Bourgeois and urban women travel, socialize, work, study, and live freely although, as in the villages, they usually live with their families until marriage. Since approximately half the population of Greece now resides in Athens, most Greek women have considerable freedom (although disapproval of this "wanton" lifestyle is often expressed when city-dwellers return to the family village).

Two aspects of women's lives in Greece are distinctive from other western cultures. First is the continued use of the dowry (despite 20th-century legal sanctions) given by the bride or her family to the groom upon marriage. The bride's age and social position, especially relative to the groom's, determine the size of the dowry. In rural communities the dowry often takes the form of a house (Dubisch, in Loizos and Papataxiarchis, 1991, p. 36) located in the wife's area of residence. Thus, while Greece itself is essentially patriarchal (if not sexist) in its attitudes towards women, the dowry creates a matrilocal structure whereby women have greater familial support after marriage than men necessarily do.

Second is the general segregation of the sexes, especially after marriage, in non-urban areas. As in previous ages, outside the home is male territory, notably the *kafeneia* (cafés) where women are very rarely found. The household is feminine space, where women with female friends and family spend both free and working hours. Thus, women have the opportunity for equally fulfilling social interactions and community; they are simply less visible to the casual observer.

Women's cults

In antiquity women played a significant role in religion, and the existence of female divinities in the Greek pantheon has led many scholars to investigate further the relation between mortal women and their gods and goddesses. Some cults were exclusively practised by women, whereas in others women participated by fulfilling certain roles. Not surprisingly, many women's cults were closely associated with female divinities.

The Brauronia, originally a local festival at Brauron in Attica, became associated with the goddess Artemis. Girls between 5 and 10 years of age were sent by their mothers in procession to Artemis, the eternal virgin goddess. Artemis is also connected with childbirth, and therefore many women's cults are related to her. According to evidence from Plutarch (*Aristides*, 20. 6), young women would make premarital offerings to Artemis, a goddess associated with transition in a woman's life. Women participated fully in cults that honoured Demeter. Besides the Eleusinian mysteries the festival of Thesmophoria was widely celebrated among women, who performed fertility rites. The festival took place in the autumn and was open to women only. Demeter, together with her daughter Persephone, and Dionysus were worshipped at the festival of Haloa in December. Demeter, the goddess of grain, was often worshipped with Dionysus, the god of wine. In Arcadia she was worshipped with Poseidon. In later times she was syncretized with Gaia and Rhea, or Cybele.

Women played an important role in civic festivals. In the Panathenaia they were the ones who wove and presented the *peplos* (a special embroidered robe) to Athena, and on the night before the procession that held central place in the festival they performed ritual cries and choral dances. The Athenian festivals occurred in early and midsummer in the

following order: first the Plynteria and Kallynteria (cleansing and beautifying festival), then the Skira (threshing festival), and finally the Panathenaia. The Arrhephoria was a mystic festival in honour of Athena that took place in midsummer parallel to the Panathenaia. Four girls of noble families had to spend some time at the temple of Athena: two of them had to present to the goddess the *peplos* that the women had woven, and the other two received coffers from the priestess, the contents of which could not be revealed, and carried them in the great procession.

Many women's cults had a strong local element, such as the cult of Hera, the goddess of marriage and domestic life, in places like Argos and Samos. The cult of Dionysus was particularly associated with women. Dionysiac orgies were celebrated on Mount Parnassus by cult associations of women, and were later incorporated in the cult of Apollo at the same place. In later times, especially in Hellenistic Alexandria, women performed lamentation rites for Adonis after the celebration of the wedding of Adonis and Aphrodite. The Adonia was also celebrated in Classical Athens in the spring. Rituals of incubation, like those connected with Asclepius, were also popular among women, but were not exclusive to them.

Women also played an important role in official and mystic cults as priestesses. (It should be noted that there was no such thing as a caste of priests or priestesses.) Many priesthoods were filled by women only, mainly for the cults of goddesses. There were various rules as to the status and age of a priestess. The priestess of Athena was a married woman, whereas virginity was required for priestesses of Hestia. Pythia was the name given to the priestesses of Apollo who played an important role in Greek history by giving the oracular response on many important public and private matters.

Heroines held an important position in women's cults. Various phases of life involving marriage, pregnancy, and children were associated with specific cults of heroines, the most notable being those that feature in myths around the Olympian pantheon, such as Ariadne, Semele, and Iphigeneia. The clothes of women who died in childbirth would be dedicated to Iphigeneia at Brauron, but of those who survived to Artemis. There were other cults addressed to less well-known heroines in myth, such as the celebration of Hecale in the Attic deme of the same name, a heroine mostly known from the cycle of myths around Theseus. At Olympia Pelops and Hippodameia were honoured in an agonistic setting. Last but not least comes the expression of religious feeling towards a divinity, or often in heroic cults, in choral contests as an agonistic ritual.

Women played an important role in the spread of Christianity, and although there are no women priests in the Orthodox Church, women have filled various offices in the structure of the Church, for example, as deaconesses. Many have followed the monastic life, like men, without being priests. Just as there are spiritual "Fathers", so there are also "Mothers", although most women religious lived in monastic communities rather than in the desert. The ascetic life is presented by many Fathers of the Church as a model for life in the household, denoting the sacrifice needed.

Many modern Greek folk customs exhibit the influence of antiquity and many festivals are celebrated exclusively or predominantly by women. There are many practices associated with the cult of the Virgin Mary in which women play an important role. Their importance in certain cults, and particularly how they are represented in various customs, varies from place to place. Although certain rites of passage, like marriage and death, have official ceremonies within the Church, there are many customs forming part of the local cult that are practised by women only. Every village in Mani or Crete has its *moirologistris*, who will perform rites of lamentation, beyond those at the official service in the church, sometimes with the tolerance of the Church but often without it.

Woodworking

Ancient Greek carpentry is not well known because of the lack of permanently dry or permanently waterlogged conditions that favour the preservation of wooden objects. Carpentry, moreover, is not a craft that lends itself to written description. Theophrastus wrote much on the choice and preparation of timber, but this amounts to little more than the lore which carpenters thought fit to relate to him; much of it seems to be nonsense or misunderstood.

Greek buildings were walled with stone or mud brick, but sockets reveal something of the missing timbers. Almost every building had a timber roof, often upper floors, and usually joinery (in windows and doors), none of which survive. Temple roofs could be mighty timber structures, but involved timbers merely resting on each other; internal walls reduced the span and usually made it unnecessary to use timbers more than

about 10 m long. Sophisticated carpentry with tension-transmitting joints, of the kind found in Western cathedral roofs, was apparently unknown. The oldest surviving, still functional timbers are the original wooden blocks that join the column-drums of the Parthenon and prevent them from disconnecting in an earthquake. Occasional timber elements survive in Roman buildings.

Furniture, as known from vase painting, was rich and varied, at least among the well-to-do, but there is little evidence of its construction. Musical-instrument-making involved complex woodworking: a lyre, for example, was a clever piece of miniature engineering. Military equipment, especially artillery, could involve massive timber structures.

Our knowledge of Greek shipbuilding comes from underwater excavation of the wrecks of cargo ships (not triremes, which had a positive buoyancy and thus never sank). Ancient Greek shipbuilding was as complex and sophisticated as any that the world has seen. As with other ancient ships, the hull was built as a shell of planks and the ribs added later. The planks were ingeniously and laboriously joined edge-to-edge by hundreds of tenons hidden in their thickness. As in all subsequent ages, the size of ships was limited by the length of the longest tree. Timber was usually brought from a distance: it is unlikely that Greek shipbuilding was ever on a scale which used timber faster than the growth of trees could replace it.

Timber shipbuilding continued into the Byzantine period and beyond. It became assimilated to northern European methods of construction, the skeleton being built first and the planks then added. In this form it still continues on the Greek islands, and on a larger scale in western Turkey.

The craft of coopering is north European, and reached Greece in the Middle Ages, when barrels replaced amphorae and pithoi for storing wine, and to some extent oil. Barrels were often prefabricated in Venice or elsewhere and assembled in Greece from loose staves and heads. The Cretan style of watermill, with its elaborate carved turbine, is probably a medieval invention.

Timber-framed building was known to the Minoans, but probably not in Classical and Hellenistic Greece. Timber-framed houses, with overhanging upper storeys and brick or stone infill, are found in parts of northern Greece and the islands. They are mainly urban – there are good examples in Siatista (Macedonia) and Chania and Herakleion (Crete) – and appear to be of the 18th and 19th centuries. In remote country districts outhouses with earth-fast posts and woven wattle walls are still to be seen. Timbers are often built into stone or mud-brick walls as reinforcement. Tile-covered timber roofs of the 19th and early 20th centuries often follow a Roman pattern; there are some large examples on warehouses in Crete. Timber is not often a medium for architecture or decoration in ordinary houses: exceptions are house doors, and the magnificent carved and painted house interiors of the island of Karpathos.

Surviving furniture begins with the cypress chests made in Sphakia (Crete) for export in the 15th and 16th centuries, and now to be seen in churches and museums all over Europe. The icon painter's craft begins with the joining of pieces of board (usually cypress timber) edge-to-edge with hidden nails to form a panel. In a few churches an ancient iconostasis survives as a monument of fine joinery and woodcarving.

World War I 1914–1918

The history of Greece's participation in World War I is inextricably linked with the first phase of the national schism. As the Great War broke out in the summer of 1914, Greece had only been at peace for a year, following the end (in summer 1913) of the highly successful Balkan Wars, during which it had almost doubled in population and size.

With the European conflict under way in August 1914, the Greek leaders disagreed as to the course the country should follow. The prime minister, Eleftherios Venizelos, who commanded a substantial majority in parliament, was in favour of entering the war on the side of the Entente. He was convinced that the Entente would eventually be victorious. In any event, it was clear that Greece, a maritime country, was not strong enough to withstand British and French naval power in the Mediterranean and was therefore easily susceptible to Entente pressure. This was a fact that had been demonstrated repeatedly by the naval blockades of the country during the 19th century.

On the other hand, king Constantine I had studied in the German Military Academy and was an honorary field marshal of the German army; he was a firm believer in Germany's military might. There was also a dynastic link with the German royal family: Constantine's wife, Sophia, was the kaiser's sister. All the above made credible at the time the allegation that in August 1914 he offered the kaiser the services of Greece, though little evidence of this has been found. It is clear that, personal preferences aside, Constantine did favour neutrality, in the belief that Greece's interests as well as those of the Greek populations of the Ottoman empire would be better served by this course of action. The division between the king and his prime minister was to persist and fester, with disastrous consequences.

In any event, in September 1914 under the premiership of Venizelos (and initially with the consent of the king) Greece offered to join the Entente. The offer was rejected by all three powers: Britain wished to avoid provoking the Ottoman empire (at the time neutral) into joining the Central Powers; France reserved the right to accept the offer at a later stage; and Russia was prepared only to accept any help that Greece

could offer to Serbia. The result was that initially Greece stayed formally neutral; yet, even with the best intentions, this neutrality was increasingly difficult to maintain in the face of the unravelling of events in the region and the world.

The Ottoman empire entered the war on the side of the Central Powers in November 1914; nevertheless, the main opponent for Greece was not Ottoman Turkey but Bulgaria, which remained out of the war for another year, making any decision on the participation of Greece in the war more difficult. Both Greece and Bulgaria were wooed by both sides, but both bided their time.

During the last months of 1914 and the first months of 1915 the struggle between Venizelos and Constantine intensified, centring around the participation of the Greek military in the Dardanelles campaign planned by the Entente. In return for joining the Entente, Greece was allowed to occupy northern Epirus and was offered unspecified gains in Asia Minor after the war. Britain also promised to discuss the future of the island of Cyprus, inhabited by a large Greek majority.

Venizelos, initially with the consent of the king and the crown council, had offered the Entente a Greek army corps for the Dardanelles operation; when later on Constantine changed his mind (influenced by the views of his chief of staff, Ioannis Metaxas), Venizelos scaled down the offer to a division, in an attempt to regain royal assent for Greek participation. This was not forthcoming. In any event, from the first months of 1915, the island of Lemnos was used as a base by the Entente forces for the Dardanelles campaign, even without Greek participation in the operation. At this point the disagreement between king Constantine and prime minister Venizelos on the question of maintaining neutrality or entering the war on the side of the Entente Powers became acute and sparked off the government crises of 1915.

Venizelos was dismissed in March 1915 but was then returned to office with a comfortable majority in the elections of June 1915. Following the mobilization of the Bulgarian army in September 1915, Venizelos persuaded the king to order the mobilization of the Greek army and invited the Entente to land forces (later to be dubbed the "gardeners of Salonika") in Thessalonica, in the north of Greece, in a desperate attempt to help Serbia; the plan was carried out initially with the consent of the king, who, however, was later once more to change his mind.

On 4 October 1915 Bulgaria declared war on the Entente and attacked Serbia; Greece was still bound in alliance with Serbia under the terms of the treaty of 1913, though it had refused to come to Serbia's aid when a European power (Austria-Hungary) had attacked it. Now that Bulgaria had attacked Serbia, the conflict was assuming a Balkan dimension. Venizelos was in favour of coming to the aid of Serbia, and even secured the assent of the Greek parliament to this end, but the next day he was again dismissed by the king, who also dissolved parliament. A government controlled by the palace was set up. It declared a benevolent neutrality towards the Entente; it also declared that the 1913 treaty of alliance with Serbia applied only to a purely intra-Balkan conflict and not to a war where a Great Power was involved. Subsequently no Greek troops were allowed to move in aid of Serbia. That remained the case even when Britain, in a desperate last bid to help Serbia, offered Greece the cession of Cyprus in return for its immediate participation in the war; Zaimis, the prime minister at the time, refused the offer, which was never repeated. With Greek forces unavailable, the small Entente forces in Thessalonica were unsuccessful in their offensive; the Bulgarian and Austrian forces soon overpowered Serbian resistance and occupied Serbia. The inability of the Entente to help Serbia undermined Greek confidence in it, as did reports about the treaty of London (April 1915), by which the Entente ceded the Dodecanese islands (claimed by Greece) to Italy, promised to Italy territory in Asia Minor (where large Greek populations were present), and effected a partition of Albania most favourable to Italy; further demands for the evacuation of northern Epirus (where Greek troops were replaced by Italians) did little to shore up Greek confidence in the Entente. Further Entente actions such as the demand for all Greek troops in Greece to be moved to the Peloponnese, for war materiel to be handed over, and for a change of government in Athens as well as the obvious failure of the Dardanelles campaign (which was eventually wound up in January 1916) added to Greek doubts.

Venizelos's Liberals abstained from the elections called for December 1915. The (royalist) Populist Party secured a very large majority and another government controlled by the palace was set up; Greece continued to remain formally neutral, but the Athens government allowed the German and Bulgarian forces to occupy Fort Rupel and the region of Kavalla, ordering the Greek 4th Army Corps in the region not to resist. Subsequently, several thousand Greek officers and men of the 4th Greek Army Corps spent the rest of the war as "guests" in Gerlach, Germany. The Athens government also had to allow the landing on the island of Corfu of the remnants of the Serbian army evacuated by Entente ships from the Adriatic coast after the collapse of Serbia, though it later refused to allow their transport overland to Thessalonica, to join the Anglo-French forces stationed there. Greek neutrality was becoming increasingly threadbare.

In October 1916 Venizelos left Athens and went to Crete; from there he issued a proclamation to the Greeks, inviting them to help "save what could still be saved" and landed in Thessalonica. There he put himself at the head of the national defence movement (*Ethniki Amyna*) and formed the provisional government of Thessalonica. This duly declared war on Germany and Bulgaria; but the Entente followed an ambiguous policy, supporting the provisional government, but not actually extending formal international recognition to it.

Between October 1916 and June 1917 Greece was divided in two and in a state of civil war: the north of the country, most of the islands, and Crete were under the provisional government under Venizelos; the south of mainland Greece and the Peloponnese were under the control of the king and his government. In both parts of Greece opponents were persecuted. In Thessalonica the national defence government began organizing an army, drawing from the manpower available to it in the parts of Greece it controlled, with the aim of participating as quickly as possible in the war effort of the Entente. The army used numbers of Venizelist officers who joined it, as well as numerous volunteers who travelled to the north of Greece to join up, often driven to do so by the excesses of the royalists or the oppression and even pogroms Venizelists had to suffer in the south.

The conditions deteriorated further with the abortive Entente attempt to depose the king by force in December 1916 and the subsequent blockade of the part of Greece controlled by the royalists; Piraeus, the largest port of Greece, was also occupied. In June 1917 the Entente presented an ultimatum to Constantine, requesting his abdication. On 12 June 1917 Constantine appointed his second son, Alexander, in his place (but did not formally abdicate) and left the country. A largely French force extended the Allied occupation from Piraeus to Athens and deported some staunch royalists (including Ioannis Metaxas) to Corsica. By the end of June 1917 Greece was forcibly reunited, with Venizelos as its prime minister. It declared war on the Central Powers and mobilized, offering 12 divisions for the Thessalonica front, provided they could be armed by the Entente; but six months elapsed before the Allies could provide the necessary equipment. Nevertheless, by late spring 1918 around 250,000 Greeks were fighting alongside French, British, and Serbian forces in the front to the north and east of Thessalonica, facing Bulgarian and German armies.

The Greek forces played an important role in the Allied offensive that began on 15 September 1918. The offensive was a success: the front was rolled back, the Bulgarian and German armies collapsed, and the Allied forces pursued them into Bulgaria and Serbia. In little more than two weeks Bulgaria was asking for an armistice. Six weeks after the beginning of the offensive, both Bulgaria and Turkey had capitulated, virtually the whole of Serbia was recovered, and the position of the Central Powers was precarious. This operation, later described as the Allied drive into "Germany's soft underbelly", helped significantly to end the war. Strategically, it was also to colour German and Allied thinking in World War II: in the spring of 1941, with the war well under way, the German intervention in the southern Balkan region was partly a result of the fear of a repetition of the events of the previous war and an attempt to forestall the creation of another Thessalonica front.

Despite difficulties, Greece did find itself on the winning side at the end of the war, with additional territory allocated to it in western and eastern Thrace and Asia Minor. Indeed, the treaty of Sèvres and the treaty of Neuilly, which formally ended the war for the Ottoman empire and Bulgaria respectively, almost spelt for Greece the realization of the Great Idea, with Greece becoming a country spanning "two continents and five seas". Yet, as was the case in Western Europe, the postwar settlement was not to last.

World War II 1939–1945

Prior to the war Greece was under the ultra-conservative dictatorship of prime minister Ioannis Metaxas and king George II. The main objective of the dictatorship was to crush labour movements and liberal left-wing parties. Although Metaxas's style of government was similar to Mussolini's Italy and Hitler's Germany, ideologically Metaxas embraced the Greek monarchy, an institution supported by Great Britain, and Greece sided with the Allies (British Empire, France, later the USA) against the Axis powers of Europe (Nazi Germany, fascist Italy) and their satellite countries, including Bulgaria, Croatia, Hungary, Romania, and Slovakia. Metaxas's dictatorship, which was established on 4 August 1936, suspended the Greek constitution and dissolved parliament, consequently resulting in the suppression of civil liberties, as well as the prosecution of liberal and left-wing social activists.

On 28 October 1940 fascist Italy declared war on Greece by launching an invasion from Albania, a country already under the occupation of Italian armed forces. Italy's invasion had been approved by Hitler in order (*a*) to prevent the establishment of Allied forces in Greece, which could have strategic importance in the Balkan area, and (*b*) to facilitate his military campaigns in North Africa. The efforts of the Italian army to conquer Greece failed. By 2 November 1940 the Greek army had evicted the Italian invaders and by March 1941 the Greeks had advanced deep into Albania.

On 6 April 1941 the German army intervened to assist the Italian forces. The invasion came from Bulgaria and Yugoslavia to destroy the Greek armed forces, crush all British forces in Greece, and secure the south flank of the Balkans from Allied attacks, while the Nazis invaded the Soviet Union. Many of the Greek government leaders, including king George II himself, and units of the Greek army and navy, escaped to the Middle East, notably Egypt, where they established a government in exile.

On 28 April 1941 the Nazis established a Greek government of collaboration in Athens, to have more effective control of the enslaved Greeks and eventually prevent movements of national liberation. The Greek army general George Tsolakoglou was appointed by the Nazis as the leader of the quisling government and Colonel Angelos Everet as the commander of the police forces. The occupying forces destroyed the country's economy, taxed and terrorized the Greek people, and seized their food supplies. Consequently, over 250,000 Greeks died from starvation.

After the oppressive triple occupation and the establishment of a Greek-German government of collaboration, national resistance (*Ethniki Antistasi*) movements were organized with the help of the Allies, and England in particular. On 27 September 1941 the *Ethniko Apeleftherotiko Metopo* (EAM, the National Liberation Front) was organized with the cooperation and participation of centre-left Greek political parties (*a*) to liberate Greece from the Axis armed forces, (*b*) to hold free elections after independence without foreign intervention, and (*c*) to establish a people's government without a king. The Communist Party was the nucleus of the movement and provided leadership and central planning.

Another but smaller organization of the resistance movement was the *Ethnikos Dimokratikos Ellinikos Syndesmos*

(EDES, the National Democratic Hellenic Union) under the leadership of Colonel Napoleon Zervas. This organization, whose objectives were poorly defined, was ineffective as a political and military force and on occasions it established policies of coexistence with the Nazis. Other smaller resistance groups under Britain's Special Operations Executive (SOE), a wartime intelligence and sabotage agency, played an important role in collecting intelligence for Allied forces and committing acts of sabotage against the Axis.

Although the participants of the national resistance came from all socioeconomic backgrounds, the movement was strongest among the middle classes (e.g. civil servants, professionals, merchants, shopkeepers) in the urban areas, and among the wealthy peasants in the rural areas. Many leadership positions in the EAM went to left-wing or liberal professionals who were motivated by patriotism, as well as values of social justice. The communists made up approximately 15 per cent of the leadership and rank and file of the EAM/ELAS. Women also played an important role in the resistance movement as participants in combat as well as providers of medical aid, information, supplies, and ammunition.

The EAM became the most popular resistance movement by building a firm political and economic infrastructure to deal not only with the Axis occupation, but with other social problems including hunger, social inequality, illiteracy, and women's issues. On 12 April 1942 EAM organized the first labour strike in Athens and on 22 May of the same year entrusted Ares Velouchiotis (the nom de guerre adopted by Thanasis Klaras), a non-commissioned officer in the Greek army, to organize the first team of the *Ethnikos Laikos Apeleftherotikos Stratos* (ELAS, the National Popular Liberation Army) – the military wing of the EAM (National Liberation Front). By the early part of 1943 the EAM/ELAS movement increased rapidly and demonstrated its strength, not only by military operations against Axis armies, but also through organized labour strikes in large Greek cities and the establishment of social and educational programmes in liberated territories. More than 2,150,000 men and women (approximately 30 per cent of the population) were active members of EAM/ELAS auxiliary organizations, including EPON (Panhellenic Organization of Youth), *Ethniki Allilegie* (National Solidarity), a charitable organization, and PEEA (Panhellenic Committee of National Liberation) to serve as a temporary government in liberated Greek territories. Through PEEA, EAM empowered women with the right to vote for the first time in Greek history.

The rapid growth of the EAM/ELAS movement created frustration among the occupying Axis armies and the "collaborationist" government of Greece. In April 1943 the Nazis appointed Ioannis Rallis as prime minister of the quisling Greek government to suppress resistance movements. Rallis and the Nazis organized the Greek Security Battalions (*Tagmata Asphalias*) to counter EAM/ELAS forces. The battalions consisted of more than 20,000 men who were active in large cities and the Peloponnese. Their main functions were to minimize Nazi casualties and carry out reprisals against the civilian population sympathetic to the resistance movement.

The Security Battalions consisted of ex-officers and enlisted men of the Greek army, as well as civilians, with ultra-right-wing leanings, many of whom were members of pre-World War II Greek fascist organizations. The majority of the collaborators were influenced by Nazi propaganda claiming that all of EAM/ELAS members and their supporters were communists who had to be eliminated. It has been estimated that about 10 per cent of the Greek population collaborated or were sympathetic to the occupying Axis forces.

By October 1943 ELAS had emerged as the only effective and disciplined military organization under the supreme command of a Greek army officer, Stephanos Sarafis. In the summer of 1944 ELAS had about 80,000 regular troops and over 40,000 reservists. They participated in more than 600 battles causing enemy troops many casualties, including 21,800 dead, 8276 wounded, and 6370 taken prisoner. The heavy casualties inflicted on the Axis resulted in enemy reprisals against Greek citizens. More than 50,000 Greeks were executed by the occupying Axis armies and their Greek collaborators. Executions of Greek citizens by the Axis forces resulted in counter-reprisals against enemy collaborators by vengeful relatives of victims.

During their three and a half years of military action, Greek resistance organizations, and EAM/ELAS in particular, made at least five major contributions to the war against the Axis powers: (1) Through labour strikes and military operations the resistance movement forced the Nazis to abandon their plans for recruiting Greek citizens to work in German industry or to serve in Nazi auxiliary miliary units outside Greece. (2) Greek resistance forces preoccupied and effectively fought more than 300,000 enemy troops who could have been used against Allied forces in other fronts. (3) Through intelligence operations Greek resistance groups kept the Allied command in the Middle East informed of Nazi movements that could launch a surprise attack against Allied forces in North Africa. (4) The Greek resistance forces obtained or destroyed many thousands of tons of enemy ships and supplies, including ammunition, medicine, food, and clothing. (5) With the capitulation of Italy on 8 September 1943 leaders of the Greek resistance persuaded the Italian army division Pinerolo, which was serving as an occupying force in Greece at that time, to surrender to ELAS forces. The commander of the Pinerolo division, General Adolfo Infante, signed an agreement with ELAS leaders to recognize his unit of 12,000 men as an Allied force. On 14 October 1943 the Pinerolo division was disarmed by the ELAS commander, Ares Velouchiotis. These Italian soldiers participated in ELAS combat missions against Nazi troops, intelligence operations, and transportation of supplies.

After the withdrawal of the Axis forces from Greece in October 1944, the political aims and objectives of EAM/ELAS forces to participate in Greece's post-liberation politics and economic reconstruction were challenged by the Allies. The British, who feared that the popular EAM/ELAS forces would form a post-war leftist government without a king, intervened immediately to demobilize ELAS, form a post-liberation Greek government representing pro-monarchist and ultra-right-wing conservative parties, hinder the process of bringing traitors and collaborators to trial for war crimes, and organize a post-liberation Greek army of right-wing officers and enlisted men, many of whom had served in the pro-Nazi Security Battalions. These armed forces came under the tutelage of the British devoted to the palace, anti-communist to the point of fanaticism, with little respect for democratic procedures.

In December 1944 ELAS units and British forces accompanied by pro-monarchist Greek army units clashed in Athens, resulting in the death of 17,000 combatants and civilians. The ELAS army, which consisted of many thousands of non-proletarian resistance fighters of peasant origin, became fragmented with the unfolding of political events. Most of the ELAS leaders decided in favour of peaceful solutions and not to continue the war, this time, against the British and the ultra-conservative government in Athens. They ultimately realized that post-war Greece was to remain under Britain's sphere of influence.

With the return of a pro-monarchist and vengeful right-wing government to power, members of EAM/ELAS forces were labelled as communists (the leftist bad guys), antinationalists, and were excluded from civil service jobs and the armed forces. Many thousands were unjustly terrorized by paramilitary right-wing groups, imprisoned, tortured, sent into exile, or tried in military courts and executed by army firing squads. The commanders of ELAS forces, unlike other successful commanders of the victorious Allied armies, were discredited and prosecuted. Rather than falling into the hands of his former enemies – ex-Nazi collaborators – the pioneer commander of ELAS, Ares Velouchiotis, committed suicide. The Supreme Commander of ELAS, General Sarafis, and 30 of his senior ELAS officers were arrested and exiled to the Greek island of Macronisos.

By the end of 1945 the British succeeded in establishing a new Greek government under the leadership of Themistoklis Sophoulis, a leader of the conservative populists. Sophoulis announced the first national elections in Greece since 1936 to be held on 31 March 1946. The leftist political forces and even supporters of liberal-centre parties abstained, contributing to a victory of right- wing coalition under the leadership of Dino Tsaldaris. The new coalition government, under anomalous circumstances (e.g. using out-of-date electoral registers, intimidation of voters by pro-monarchist police forces, and British pressures to restore the monarchy), held a plebiscite on 2 September 1946, resulting in the return of king George II to serve Great Britain's geopolitical interests in the area and prevent radical institutional changes, as demanded by the leftist EAM forces.

The reestablishment of the monarchy, along with a right-wing coalition government, increased political polarization in Greece and the prosecution of leftist and liberal elements, especially ex-members of EAM/ELAS organizations. The systematic prosecution of members of Greek resistance forces by the post-liberation pro-monarchists and right-wing governments was an important factor contributing to the Greek Civil War (1946–49) between nationalists (pro-monarchists) and leftist forces, costing over 160,000 lives and billions of dollars' damage to property. The leftist forces of the Civil War consisted mainly of ex-EAM/ELAS members who were forced by an ultra-right-wing government and para-military groups (e.g. X-ites) either to resort again to the mountains or let themselves be beaten, tortured, murdered, or exiled to concentration camps.

Xanthus

City in Lycia

The river from which the city of Xanthus takes its name appears frequently in Homer's *Iliad* (though it should not be confused with the alternative name for the Scamander). It is where Sarpedon's kingdom is based, and where his body is taken for burial after his death.

In historical times Xanthus was the economic, political, and cultural centre of Lycia down to the Hellenistic period. Subsequently, other cities in Lycia, such as Patara and Myra, came to rival it in importance, but Xanthus remained one of the prime Lycian settlements until the general abandonment of the Lycian cities in the Arab invasion of the 7th century AD. As such, it stands as an epitome of many of the cultural developments and interactions with the Greek world that are to be found generally in Lycia; indeed, it is not unknown for ancient Greek authors to use the terms "Xanthus" and "Lycia" as if they were synonymous.

The best-known Lycian writer of the Classical period, Menecrates, came from Xanthus. Xanthus has one of the earliest examples of sculpture executed by Greek (or Greek-trained) artists to a Lycian commission, the so-called Lion Tomb (6th century BC). The centre of the "dynastic" system of rule was in Xanthus, and it was dynasts associated with Xanthus who were the first to put their portraits on their coinage. They were also the first to use Greek inscriptionally, commissioning poets to compose appropriate lines in praise of them (e.g. the 12-line epigram on the "Inscribed Pillar" at Xanthus of the late 5th century BC, and the poems by Symmachus of Pellana in honour of the dynast Arbinas of the early 4th century BC at the Letoum sanctuary).

The national sanctuary of Lycia was the Letoum, in the territory of Xanthus. Originally this was associated with a manifestation of the Anatolian mother goddess, but later was assimilated to Leto, and so many of the traditions that associated Leto and her children with Lycia are centred upon Xanthus and the Letoum. It was probably here that Alexander was supposed to have discovered a tablet indicating that he would conquer the Persian empire (Plutarch, *Alexander*, 17. 4–5). By the 2nd century BC the Letoum had acquired two large temples, one of Leto and one of Apollo, complementing an earlier late-Classical temple of Artemis; all three temples probably replaced earlier structures.

In the Hellenistic and Roman periods Xanthus, like the rest of Lycia, became further integrated into the Greek world as a whole, acquiring many of the typical features (theatre, etc.) of a Greek polis. An example of how integrated Xanthus was is provided by a unique document of 206/05 BC (*Supplementum epigraphicum Graecum*, 1923– , 38. 1476), recording an appeal made by the Cytenians in Aetolia to the Xanthians, appealing for help from Xanthus on the grounds of mutual kinship, based on their common links with Leto.

After the abandonment of the city in the 7th century AD, Xanthus was largely neglected by westerners until the arrival of Charles Fellows in 1838. His subsequent discoveries, publications, and recovery of antiquities, though ranging through much of Lycia, centred upon Xanthus, and antiquities from Xanthus had pride of place in the "Lycian Room" of the British Museum in the 19th century. The Nereid monument is undoubtedly the most famous of these discoveries. This, commissioned probably by Arbinas as his tomb, was a podium monument, deriving from other earlier Lycian monuments (such as a now destroyed building tentatively identified as a heroon (hero-shrine) of Sarpedon), but incorporating a façade modelled after a Greek temple. It directly influenced the style of the Mausoleum of Halicarnassus, and from that much of later Hellenistic and Roman funerary architecture (and beyond). The monument's sculptures, dancing figures usually identified as Nereids but probably Lycian deities of the dead, and reliefs showing scenes of warfare and the dynast's court, are now held up as typical examples of Greek sculpture of the early 4th century BC, and the Nereid monument has pride of place in the British Museum second only to the Parthenon marbles.

Summary

The ancient city of Xanthus was the economic, political, and cultural centre of Lycia. It became integrated into the Greek world in the Hellenistic and Roman periods. It was the source of the Nereid monument, probably commissioned by Arbinas (4th century BC) as his tomb. The city was abandoned in the 7th century AD.

Xenakis, Iannis 1922–

Composer

As a French citizen who has lived most of his life outside Greece, Iannis Xenakis is generally regarded as an international musical figure rather than as a Greek composer. His earliest musical influences were Greek, however, and despite the abstract, mathematical basis of his mature work, he has always claimed that there are deep links between his compositions and the Byzantine tradition of music that attracted him in his youth. Xenakis's collaboration with the French architect Le Corbusier during the 1950s and his intense interest in mathematics led him to develop new theories of musical composition. He was always fascinated by the concept of space and mass in music, and from the 1950s he made use of mathematical models such as the laws of probability, game theory, and group theory as a formal basis for his compositions. His most famous innovation was to treat sounds not as isolated points but as "sound masses", an approach that led to the creation of what he termed "stochastic music".

Iannis Xenakis was born of Greek parents in Braila, Romania. From the age of 12 he decided to devote his life to music. His earliest interest was in Byzantine Church music and Greek folk music. Although he destroyed his early compositions influenced by Greek music, his interest in the timbre and sonority of modal music affected his later musical development. In 1932 his family moved back to Greece and Xenakis attended a private school on the island of Spetsae. He entered the Athens Polytechnic to study engineering. When the war broke out, Xenakis became actively involved in resistance to the German occupation of Greece. In 1945 he was severely wounded, losing the sight of one eye. After the war he resumed his studies and graduated from the polytechnic in 1947.

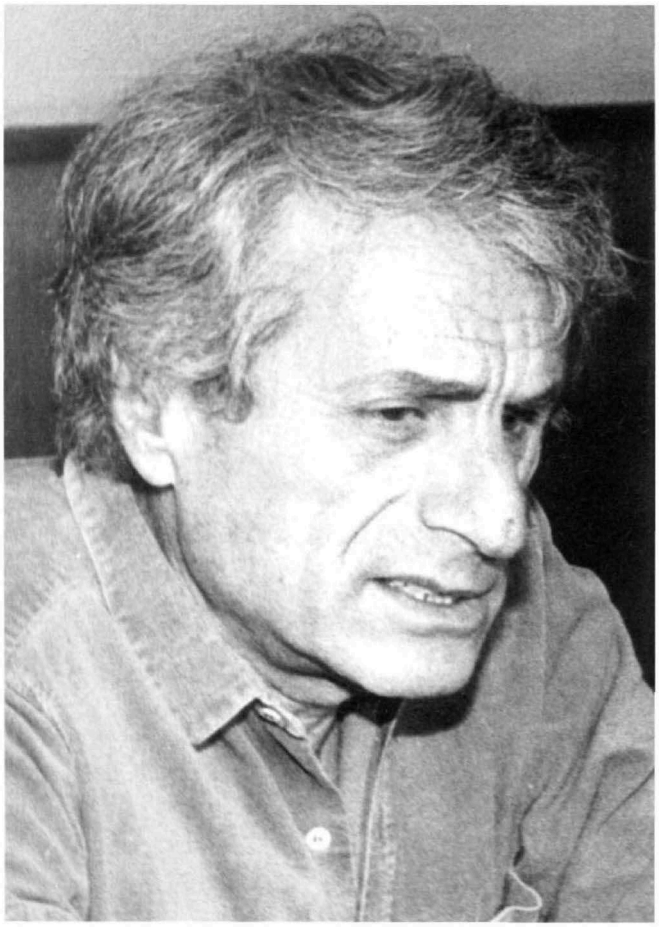
In the same year Xenakis left Greece for Paris, intending to travel to the United States. In Paris he met the leading composers of the day – Honegger, Milhaud, and Messaien – and decided to stay on. In 1950 he took up his musical studies seriously again, enrolling in Messaien's class of musical aesthetics, and working with the architect Le Corbusier. Initially he was employed by Le Corbusier to assist with some engineering calculations. Later he collaborated closely with him on some of Le Corbusier's most famous projects: the housing project for Nantes, the convent of La Tourette, the assembly building at Chandigarh, and the Baghdad stadium. In 1956 Xenakis conceived a revolutionary design for the Philips pavilion at the Brussels Exposition. Derived from the hyperbolic paraboloid, his design was influenced hy his research into new musical forms. Indeed Xenakis later claimed that his first composition, *Metastaseis*, written in 1953–54, had directly inspired his architectural design.

Metastaseis was given its first public performance in 1955 at Donaueschingen. Xenakis made use of some of the principles of serial composition in his work, but he was already reacting to the contradiction he saw in serial music between method and result. He was searching for a musical means to define what he described as "sound masses" or "galaxies". In *Metastaseis* he formed sound analogies of "ruled surfaces" by using complexes of glissandos.

In his next attempt to handle sound masses in his music Xenakis turned to the mathematics of probability. In particular, he drew on the law of large numbers. Borrowing a term from mathematics, he called his new compositions "stochastic music". His string quartet *ST/4* (1956–62) is an early example of the new technique. The theory provided the composer with limits for sound effects and with a formula to determine the probabilities of choices within those limits. His calculations could be carried out manually or on a computer. In his book *Formalized Music* (1971) Xenakis stated that his aim in developing stochastic music was "to attain the greatest possible asymmetry...and the minimum of constraints, causalities, and rules".

Xenakis's interest in indeterminacy led him to investigate the possibilities of applying another field of mathematics to his music. He turned to game theory. His first compositions inspired by game theory were *Stratégie* and *Duel* (1959–62). In his application of the theory two contestants reply in alternation to each other's tactics (passages of music). These musical passages are not chosen by the performers but stipulated by the composer, and points are awarded according to a predetermined scheme. In the compositions *Stratégie* and *Duel* rival conductors direct their own groups of instrumentalists. In *Linaia-agon* (1972) a solo trombone plays against a duo of horn and tuba in a contest that resembles a musical game of chess.

From the early 1950s to the early 1960s Xenakis had been concerned with introducing chaos and disorder into his music. The images he used to describe his music were generally derived from mass phenomena such as the behaviour of crowds of people or the burst of rockets in a fireworks display. In the mid-1960s he decided that he had explored this direction long enough and began to investigate new theoretical possibilities based on symbolic logic and set theory. *Herma*, a piano piece from 1960–61, was the first of the compositions Xenakis described as "symbolic music". Taking his analogy from set theory, the composer used sets drawn from the pitches of the equal-tempered semitone scale. *Nomos alpha* for cello (1965–66) was another early attempt to apply set theory to his composition.



Iannis Xenakis

An important result of Xenakis's work with set theory was the development of a concept of "outside time structure", i.e. of a collection of values for one sound aspect. He was led to this concept partly by the realization that western music has a much smaller range of pitch and rhythmic variation than ancient Greek, Byzantine, or many kinds of folk music. In *Nomos alpha* the quarter-tone rather than the semi-tone is used as the unit interval for establishing sets of pitches.

Xenakis's experiments with mathematical theory and attempts to develop a new approach to composition brought him great popularity in Europe and the United States during the 1960s and 1970s. From 1967 to 1972 he taught for several months of each year at Indiana University, Bloomington, where he founded a sister institution to the Équipe de Mathématique et d'Automatique Musicales, an institution he had established in Paris to stimulate research into musical theory. He also toured the world giving lectures on composition and aesthetics.

Xenakis has always been interested in electronic music and was quick to explore the possibilities of computers. In 1975, he created UPIC, a computer-based electronic music system which allows people with no prior knowledge of composition or

computers to create their own works. He began composing his own electroacoustic works for tape in the late 1950s and has continued to produce electronic works, including *S. 709* in 1994. During the 1980s and 1990s Xenakis also produced a steady stream of works for solo instruments, chamber ensembles and orchestra. Many of these pieces are Greek at least in name. They include *Alax* (1985) for 30 players divided into three ensembles, *Horos* (1986) for 89 players, and *Ioolkos* (1995). Despite a decline in the popularity of avant-garde classical composition during the last two decades of the 20th century, Xenakis has remained an active and widely admired composer, receiving numerous international awards for his contributions to modern music. In 1997, the year of his 75th birthday, his music was featured in a series of concerts all over the world, including the premiere of *Sea-Change*, a work commissioned for the BBC Proms, and *Omega*, for percussion and ensemble, written for the London Sinfonietta.

Most of Xenakis's works are not only connected with mathematics, but with ancient Greek literary sources, as their titles and texts indicate. An exception is *Nuits* (1967–68). The dedication of this choral composition ("For you, unknown political prisoners...and for you, the thousands of forgotten whose very names are lost") suggests that Xenakis has remained committed to the cause of human freedom, even though he never became actively engaged in politics after he left Greece. Not only in its dedication but also in its exploration of the resources of the human voice, *Nuits* is often considered the most moving of Xenakis's compositions. It suggests that whether or not the composer's theories of music will outlast him, his genuine musical gifts have made an important contribution to 20th-century music.

GAIL HOLST-WARHAFT

Biography

Born in Romania in 1922 to Greek parents, Xenakis moved to Greece with his family in 1932. He attended a private school on Spetsae and studied engineering at the Athens Polytechnic. He left Greece in 1947 and studied in Paris under Messiaen. He collaborated with the architect Le Corbusier. Interest in his mathematical approach to musical composition, high in the 1960s and 1970s, has declined since the 1980s, though he has remained active as a composer.

Xenophon *c.*430–*c.*353 BC

Athenian soldier, philosopher, and historian

Unrivalled in the ancient world for the breadth of his personal experience and the originality of his writing, Xenophon was important to subsequent ages as a Socratic philosopher and an heir to the legacy of Thucydides; as a prose stylist he was central to the Atticist and, later, the Byzantine canons.

Born into a wealthy family during the early years of the Peloponnesian War, he probably saw combat late in the conflict. In his early years he became associated with the circle of individuals who admired Socrates. His aristocratic background, association with Socrates, and an eyewitness feel in the relevant portions of the *Hellenica* encourage the view that he was involved in the government of the Thirty Tyrants immediately following the war (404–403 BC). In the spring of 401 BC he joined the Greek mercenary contingent of the army of Cyrus the Younger, who was attempting to usurp the Persian throne. Following Cyrus' death at the battle of Cunaxa, and the later abduction and murder of the commanders of the Greeks, Xenophon emerged as an important leader. When the mercenaries were absorbed into the Spartan army operating in Asia Minor, Xenophon was as well, and he remained there for the next five years. With the outbreak of the Corinthian War in 395 BC, Xenophon returned to Greece in the company of the Spartan king Agesilaus; he seems to have witnessed first-hand the battle of Coronea (394 BC). Either because of his presence in the Spartan ranks at Coronea, or because of his service with Cyrus, or perhaps both, he was exiled from Athens during this period. Thanks to his Spartan connections, he was granted an estate at Scillus near Olympia (recalled by Leake, 1830, 2. 86), where he lived until Spartan control of the north Peloponnese collapsed after the battle of Leuctra in 371 BC. Although a return to Athens cannot be ruled out (his exile was at some point revoked), he probably lived out his last years in Corinth. He was married and had two sons, one of whom (Gryllus) was killed in combat before the second battle of Mantinea (361 BC). Xenophon died soon after 355 BC.

Xenophon's corpus can be divided into three parts: historical, philosophical, and technical treatises. He wrote up a history of the Greek world from 411 to 362 BC that was known in antiquity as the *Hellenica*; it is in part a continuation of Thucydides' unfinished history of the Peloponnesian War, but takes events down through the Corinthian War, the hegemony and collapse of Sparta, and the rise of Thebes. The *Anabasis* is his account of the march of the 10,000 Greek mercenaries in the service of Cyrus the Younger. The *Cyropaedia* is a quasi-historical work that is in part a proto-novel; it treats the education and life of Cyrus the Great, the founder of the Persian royal house (the Achaemenids). Xenophon also contributed one of the very first biographies in ancient Greek literature, the encomium of his friend king Agesilaus. So far as his philosophical writings are concerned Xenophon is an important figure in the Socratic tradition. In addition to rivalling Plato with an *Apology* and *Symposium*, he wrote up a set of anecdotal remembrances of Socrates known as the *Memorabilia*. Further, Socrates also plays an important but subsidiary role in a work entitled the *Oeconomicus* (Household Management). The *Hieron* is a dialogue that features the tyrant of that name

conversing with the poet Simonides on the topic of absolute power (Socrates is not present). Xenophon also wrote a number of smaller, technical works: *Revenues*, the *Cavalry Commander*, *On Horsemanship*, and *On Hunting*. A *Constitution of the Athenians*, traditionally attributed to the "Old Oligarch", was also included in the works of Xenophon in antiquity, but is clearly not by him.

As a participant on the famous *anabasis*, as well as an observer of Greek internecine strife in the years that followed, Xenophon had experience of Panhellenism at first hand, yet he also had a more practical understanding of it than a figure such as Isocrates; while passionately devoted to the principle of an alliance of all the Greeks and the cessation of hostility between Greeks, he also recognized that war was a constant feature of Greek political life. Later historians such as Polybius (2nd century BC) and Arrian (*c.*AD 90–160), who were in a position to make comparisons with the forces of Philip and Alexander, saw the 10,000 in particular as a precursor of the Macedonian army that was to bring to reality dreams of Panhellenism. Arrian, for his part, even considered himself a "second Xenophon", and the title of his account of Alexander's conquests is telling: the *Anabasis of Alexander*. The great orator Dio Chrysostom (1st–2nd century AD) modelled his writing on that of Xenophon. Indeed, Xenophon was widely regarded as the "Attic Muse" for the sweetness of his style (see e.g. Cicero, *Orator*, 32), and was an important model for Atticist writers, even though modern studies have revealed that his work contains many non-Attic features. Xenophon of Ephesus, the novelist of the 2nd century AD, is in fact probably a nom de plume for a writer working in the tradition started by the *Cyropaedia*.

For many in antiquity Xenophon was first a philosopher and second a historian: as Quintilian says in his list of Greek and Roman historians, "I have not forgotten Xenophon, but I think he ought to be included among the philosophers" (*Institutes*, 10. 1. 75). His picture of Socrates is fundamentally different from the man we see in Plato: in Xenophon, Socrates is much more a sage interested in the practical issues of day-to-day living, from self-control to the proper training for public life, and to the ordering of the household; his piety is also a common theme. The choice of Heracles between virtue and vice from the *Memorabilia* became a popular subject in later thought and art. The story of Xenophon's first encounter with Socrates was also widely treated. He was an especially popular author with the Romans, in particular with figures such as Cicero (see, for example, his *Oratore*, 2. 58).

In late antiquity Xenophon's influence diminished somewhat: the pagan Libanius (4th century AD) read him, as did the Church Fathers Basil and John Chrysostom, but the former knew him only indirectly (the choice of Heracles story). In the early Byzantine period his importance was reestablished, in particular as a historian-soldier and prose stylist: the historian Agathias relies on him, as does the Constantinian excerptor later. For men of state who were also writers such as Nikephoros Bryennios (11th–12th century), husband of Anna Komnene and pretender to the throne, he was an especially important model. Manuel II Palaiologos (1391–1425) quotes from his work. Xenophon was among the first ancient Greek authors translated into Latin in the Renaissance, during the papacy of Nicholas V (1446–55). In the modern period his role as commander of the 10,000 was especially cherished: so, for example, the great klepht commander Androutsos (d. 1798) led his men on a march that was popularly compared with the *Anabasis* of Xenophon.

Biography

Born *c.*430 BC, Xenophon associated with Socrates in his youth and may have fought at the end of the Peloponnesian War. He was involved in the government of the Thirty Tyrants (404–403) in Athens. In 401 he joined the army of Cyrus the Younger as a mercenary. After Cunaxa (401) Xenophon led the surviving forces back to Byzantium. He then fought for Sparta at Coronea (394) and was exiled from Athens. He was given an estate near Olympia but after Leuctra (371) moved to Corinth where he died *c.*353. His writings include historical and philosophical works and technical treatises.

Yarmuk, Battle of

Battle fought between Arabs and Byzantines in AD 636

The decisive battle fought in AD 636 near the confluence of the Yarmuk river and the Wadi'l Rukkad, which today marks part of the border between Jordan, Syria, and the Israeli-occupied Golan Heights, determined the fate of Byzantine Syria. Early in AD 636 the Byzantine emperor Herakleios (who was not himself present at the battle) raised a very substantial Byzantine and Christian Arab force to reverse recent Muslim victories in Syria, Transjordania, and Palestine, and drive the Muslims out of Syria and Palestine. The site, a strategic one, included high ground, water supplies, and pasture, and dominated important routes between Damascus and Galilee. It was an important sedentary base, with pasture grounds crucial to the friendly Christian Arab tribe of Ghassan, and it lay within traditional Byzantine territory, near the intersection of the boundaries of four Byzantine provinces. A major battle had taken place near the site in 614, when the Persian general Shahrbaraz had resoundingly defeated the Byzantines, opening the way into Palestine for the Persians. The terrain's strategic significance was apparent to both sides and in theory was familiar to both.

On the eve of the battle the Byzantines had not succeeded in developing any effective new tactics or strategy for checking the Muslims. The battle of the Yarmuk, or al-Jabiya, lasted more than a month, including preliminary manoeuvrings. It began in the vicinity of al-Jabiya, the traditional base of the Ghassan, with manoeuvrings, and terminated on 20 August 636. Byzantine forces had come from Emesa under General Vahan, who was probably *Magister Militum per Orientem* (Master of the Soldiers in the East), and Theodore Trithurios, the *sakellarios* (treasurer). Jabala bin al-Ayham, king of the Ghassan, led Ghassanid forces. Other Christian Arabs, whom Herakleios had recruited in upper Mesopotamia and elsewhere, participated. There are contradictory reports concerning whether Theodore, the brother of Herakleios, was present. Although he participated in planning some of the campaign, Theodore probably had been recalled to Constantinople in disgrace before the final stages of the battle. Muslim forces under Abu 'Ubayda bin al-Jarrah withdrew from Emesa and Damascus in the face of the approach of stronger Byzantine armies from the north. They retired to a line between Dayr Ayyub and Adhr'iat, where they waited for more than a month, in a topographically strong position, to deter any Byzantine move further south. On 23 July 636 the Muslims emerged victorious after an initial clash near al-Jabiya. The Byzantines attempted to use the waiting period to familiarize their forces with the Muslims and, unsuccessfully, to encourage desertion and dissension within Muslim ranks. Both sides received reinforcements, but the decisive engagement took place when the Muslims were continuing to gain more reinforcements. The Byzantines, together with their Christian Arab allies, probably enjoyed numerical superiority, having troops that numbered 15,000 or 20,000 men, possibly even more.

The Muslims, by feigning retreat, lured the Byzantines into attacking their camp near Dayr Ayyub. The Muslims penetrated the exposed Byzantine left flank, and then exploited gaps that yawned between Byzantine infantry and cavalry. Byzantine infantry apparently attempted to lock shields and to engage in intricate, complicated, risky exercises (the so-called mixed formation) that involved opening the ranks of foot for horsemen to pass through and then relocking shields. Poor Byzantine coordination allowed the Muslims to exploit the gap and to slay many exposed Byzantine infantry. Byzantine forces withdrew into territory that lay between the Wadi'l Rukkad and Wadi'l Allan, both west of the Wadi'l Harir, to what they believed to be a secure encampment protected by the high bluffs of the wadis.

In a night raid the Muslims under the capable Muslim commander Khalid bin al-Walid seized the critical bridge over the Wadi'l Rukkad, which offered the only viable retreat route for the encircled men and animals of the Byzantine army. The Byzantines found themselves blocked and could neither retreat in formation, fight their way out, nor negotiate a reasonable settlement. Having learned that they were cut off, the Byzantines panicked. The Muslims stormed their camps between the wadis as well as at the village of Yaqusa, on the edge of the Golan Heights. The Byzantines lost cohesion and most were slaughtered, although a few may have managed to flee down the steep walls of the wadis. The Muslims took few or no prisoners. Some Christian Arabs allegedly wavered in their loyalty to the Byzantine cause and managed to flee, which aided the Muslims. One Muslim tradition reports that some dejected and defeated Byzantine troops, having perceived the hopelessness of their situation, fatalistically awaited their slaughter.

The battle destroyed the only viable Byzantine army in Syria and its commanders, who ceased to exist as a fighting force. A rout ensued. For the Muslims the victory eliminated the possibility of any Byzantine penetration further south, reconfirmed Muslim control of Palestine and Transjordania, and opened the way for the Muslim conquest of the Bika' Valley, Damascus, and, beyond it, all of Syria. The Muslims consolidated their victory by a rapid, far-reaching, and ruthless pursuit of retreating Byzantines, giving them no respite. The battle had great psychological as well as material effects: it broke the will of the Byzantines to engage in more open battle. The Byzantines henceforth avoided open battle with the Muslims in Syria and upper Mesopotamia, and ended their efforts to recover or hold Syria. Together with Emperor Herakleios, who was staying first at Emesa and then at Antioch, they evacuated northern Syria and withdrew into Anatolia, where Herakleios attempted to improvise new defences.

The Byzantines suffered logistical problems on the eve of the battle. They lacked experience in handling and supplying large numbers of troops in the region of these manoeuvrings. This inexperience may have contributed to the logistical problems they experienced and to tensions with local civilians. Byzantine leaders found it difficult to procure adequate supplies from local inhabitants on the eve of the engagements. Mansur, son of Sergius, the local fiscal official at Damascus, refused to provide supplies to the unprecedentedly large Byzantine forces. The Byzantine forces consisted of heterogenous ethnic elements, many of whom had no experience in fighting or manoeuvring in the region. Distrust, misunderstanding, and friction between Greeks, Armenians, and Christian Arabs probably existed within the Byzantine ranks. There is no indication that the local inhabitants participated in fighting on either side. The Byzantines were already suffering psychological shock from a series of recent defeats at the hands of the Muslims. Muslim losses were considerable, but far smaller than the human and material ones suffered by the Byzantines. However, all statistics for the battle, both concerning numbers of combatants and numbers of casualties, are worthy of suspicion.

The account of the battle by the Muslim historian of Damascus Ibn 'Asakir, *Tarikh Madinat Dimashk*, is probably the best. No documentary records or eyewitness accounts survive. Memory of the actual facts of the battle soon faded and quickly became embellished with legends. The magnitude of the Muslim victory received instant recognition and continued to resound later in the 7th century. The military manual entitled the *Strategikon* of Maurice, although written in about 600, provides some reliable insight into contemporary Byzantine fighting techniques and logistical strategy that were probably used in the battle. The reigning Byzantine Herakleian dynasty appears to have attempted to shake off responsibility for the disaster, blaming an alleged abortive rebellion of the Armenian Byzantine general Vahan, or to the failure to follow Emperor Herakleios' injunctions to be wary of Arab ambushes, or to adverse climate. There is no evidence that Christian religious dissension affected the outcome. Muslim writers later celebrated the role of Islamic religious zeal, but superior Muslim leadership as well as superior morale, including confidence that derived from their recent pattern of successes, were important factors in their victory. The battle sharply contributed to the permanent reduction of the importance of Hellenism in western Asia, Egypt, and north Africa.

WALTER E. KAEGI

Summary

Site of a battle on the borders between modern Jordan and Syria fought in AD 636 between the Byzantines of Emperor Herakleios and the Muslim Arabs. Decisively defeated, the Byzantines suffered heavy losses. The battle confirmed Muslim control of Palestine and Transjordania.

Ypsilantis family

Several members of the Ypsilantis family have left their mark in the Byzantine, Ottoman, and modern periods of Greek history. Ioannis VIII Xiphilinos Ypsilantis became patriarch of Constantinople in 1064, "a man perfect in virtue and eminently worthy of the patriarchal throne", according to Michael Psellos. George II Xiphilinos also occupied the throne from 1191 to 1198. After the conquest of Constantinople by the Crusaders in 1204 the Ypsilantes resettled in their native Trebizond and their fortunes were linked to the imperial dynasty of the Komnenoi. In 1390 the great *domestikos* ("commander") Constantine or Dimitrios Xiphilinos Ypsilantis married Eudoxia, daughter of the emperor Manuel Komnenos.

Following the capture of Trebizond by the Turks in 1461 the family was forced to move to Constantinople as a result of the sultan's policy to repopulate the deserted city, but according to a historical work written in the third quarter of the 18th

century by a descendant of the family, Athanasios Komnenos Ypsilantis, several of its members were still residing in Trebizond in the early part of the 17th century. During this period, Triantaphyllos Ypsilantis, a renowned merchant and warden of the monastery of Soumela, fled to Constantinople in order to save his 15-year-old daughter from incarceration in the harem of the pasha of Trebizond. He was accompanied by his nephew Ioannis, and by his three friends, the Mourouzi brothers.

It was to this Ioannis, also known as Hadji-Yannis, that the Phanariot Ypsilantes trace their lineage; he was extremely wealthy, and was executed by the Turks in his old age. His daughter Helen married Tzannetos, the son of Ioannis Mourouzis. He had three sons – Antonios, Constantine, and Emmanuel (Manolakis); the last was executed through the machinations of the *kaymakam* (district governor) Yengin Mehmet Pasha, who seized his properties in Galata, Neochorion, three houses in Therapia, 15 in Tatavla, and his ancestral house in Phanar, with all their valuable furnishings.

Hadji-Yannis's brother Constantine was *postelnikos* (chamberlain) in the Moldavian court of Michael Racovitza. His son Ioannis married Smaragda, daughter of Mariora and Laskarakis Mamonas. Mariora's mother was Roxandra, daughter of Alexander Mavrokordatos, the Exaporite (Minister of the Secrets and private secretary to the sultan). Although the Ypsilantes were continually feuding with the Mavrokordatoi, their legendary rivalry contributed also to their closeknit relationship through which they could check more effectively each other's intrigues and ambitions. Their paths crossed more than once, culminating in the showdown between Constantine Mavrokordatos and Dimitrios Ypsilantis in Greece during the War of Independence. Nevertheless, if the number of the Ypsilantes executed by the Turks is a telling sign of the risks associated with public office, one marvels at the political acumen of the Mavrokordatoi, who managed to fulfil their functions unharmed.

Unfortunately, this was not the case with Alexander, son of Ioannis and Smaragda, born in Constantinople in 1726. According to Athanasios's account "he studied Greek and philosophy, as well as Italian and French, reading and conversing in these languages with ease. He then studied Arabic and Persian, and the mixed Turkish derived from them, which he spoke thoroughly in the *mustalah* manner", that is, in the literary polished style. He was also related by marriage to the Mavrokordatoi; his wife Ekaterini was the daughter of the *spatharios* ("bodyguard") Dimitrios Mourouzis, whose mother was Sultana, daughter of the *voevod* (local governor) Nicholas Mavrokordatos. Thus, Alexander was twice related to the Mavrokordatoi: on his mother's and on his wife's side. He was appointed *postelnikos* and *nazir-viesternic*, a general term denoting the function of a minister with sweeping powers, in the court of Ioannis Kallimachi. He acted as *bashkapikehaya*, representing in Constantinople the *voivode* Skarlatos and Alexander Gikas. During the Russo-Turkish War (1768–74) he was named *vekil*, deputy to the Grand Dragoman; in 1774 he became Grand Dragoman himself. Through his influence on Abdul-Hamid he averted the general massacre of the Greeks, for the support they had shown to the Russians in the Orlov incident. He was also instrumental in the negotiations leading up to the treaty of Küçük Kaynardji, which ended the Russo-Turkish War. Soon after the treaty he was appointed *hospodar* (governor) of Wallachia. Once in Bucharest, he rebuilt the palace, reorganized the Academy by rebuilding it in the monastery of St Sava, appointed nine professors, and provided scholarship funds for 75 students; he established an orphanage, and undertook several works of public utility. He also drew up a new code, improving the legal work of his predecessor Constantine Mavrokordatos. When his two sons Dimitrios and Constantine took off to Transylvania, on what seems to have been an escapade attributed to the folly of youth, his detractors accused him of plotting against the Porte. Alexander submitted his resignation and withdrew to Rhodes. He was reappointed to his see in 1790, just before the outbreak of the war with Austria and Russia. His secret correspondence with Joseph II of Austria was intercepted by the Ottomans and he sought refuge in Brünn in Moravia where he was interned till 1792. He returned to Constantinople and withdrew from public life. When his son Constantine, who succeeded him on the throne of Moldavia in 1799, was accused of plotting against the sultan, he was captured and executed on conspiracy charges in 1806.

Constantine's popularity with the Porte was partly attributed to his translation of and commentary in Turkish on Vauban's military treatises. His plans to raise an army and liberate Greece were frustrated and he escaped to Kiev, where he died in 1816. His sons Alexander and Dimitrios were more successful in carrying out his plans. Alexander (1792–1828), who had accompanied his father to St Petersburg in 1805, served in the cavalry of the imperial guard, and fought at the Battle of Dresden, losing an arm. In 1817 he was promoted to major general and commander of the brigade of hussars. In 1820 he was elected president of the *Philiki Hetaireia* (Friendly Society) and in 1821 he placed himself at the head of an armed force composed of several Greek officers of the Russian forces, who had hoped for the support of the tsar and of the Romanian peasants in their insurrection against the Turks. They were let down by both and Alexander found himself isolated in his struggle. Following a final defeat in Dragashan, where 200 poorly armed students who had formed the Sacred Battalion died in a desperate fight, Alexander with his brother Nicholas fled to Vienna, and there they both died in extreme poverty.

His brother Dimitrios (1793–1832) had arrived in Hydra a few days before the battle of Dragashan, on 8 June 1821. Alexander had instructed him to prepare the ground for his triumphal entry into Greece. Dimitrios placed himself at the head of the Greeks in the siege of Tripolis, and when that operation was successfully completed, he moved on to liberate Argos. His continual squabbles with the local chiefs and with Alexander Mavrokordatos, who managed to take a commanding position in the first national convention at Epidaurus, on 30 November 1821, left him disappointed, despite the enthusiastic support of Kolokotronis and Makriyannis, who placed themselves and their men under him. His heroic resistance at Myloi in 1825, and the defeat inflicted on the 7000-strong Turko-Egyptian force by fewer than 500 men under his command, won him the admiration of the western world as far as America, where a town in Michigan was named after him. Ioannis Kapodistria appointed him commander of the troops

in eastern Greece in 1828. In this capacity he fought the last battle against the Turks at the pass of Petra in 1829, and he obtained the capitulation of the Turkish commander Aslan Bey.

Thus, the first battle that inaugurated his brother's insurrection against the Ottomans in Wallachia and the last battle which ended the military operations in the Greek mainland were both fought by the Ypsilantis. Dimitrios died at Vienna in 1832. Descendants of a fourth brother, Gregory, are still living in Austria.

Zagori

Region of northwest Greece

Zagori is a region of Epirus in the prefecture of Ioannina, covering an area of 1002 sq km. It is bordered by the Mitsikeli mountain region to the northwest, the Aoos river to the north, the western Pindus to the east, and the Zagoritikos, a tributary of the Arachthos river, to the west. The area is divided into three: West Zagori, East Zagori, and Central Zagori. The name *Zagori* is Slav and means "mountainous area" and Zagori is the most mountainous region in Epirus, having an altitude ranging from 500 to 2497 m; its highest peak is Gamila. Between the mountains are the plains of Dovra, Pedina or Soudena, and Vitsa and the tableland of Riziana. There are extensive forests of beech, fir, pine, and oak in Central and East Zagori, where the main occupations are forestry and stock raising. The flora and fauna of the area are quite rich: there are 219 plant species and a large number of wild animals such as wild goats, wolves, bears, and deer.

The whole region consists of a cluster of 45 villages which are built at altitudes ranging from 620 to 1340 m, usually close to springs. The rivers, mountains, forests, history, and architecture of the settlements contribute to the fame of the area as one of the most interesting and beautiful in Greece and Europe. After World War II the population of the villages was considerably reduced by emigration both within Greece and abroad because of the lack of employment opportunities. In recent years, through the controlled development of tourism in West Zagori and of logging and stock-raising in East and Central Zagori, this decline has stabilized, and there has been an increase in the size of the population. There are four main social groups: the native Zagori population; the Sarakatsans, cattle-breeders, descendants of Greek nomads of the Pindus who settled in Epirus during the 12th century; some Vlach-speaking people in East Zagori; and the Gypsies.

Although historical sources on Zagori and Epirus in general are few, archaeological survey has shown that the area has been inhabited since prehistoric times. During historical times Zagori was inhabited by Molossian tribes. One Molossian settlement has been excavated in Vitsa, which was once the summer settlement of nomad shepherds, at an altitude of 1030 m. The houses resemble those of the modern shepherds (Sarakatsans) of the area. The cemetery dates from the 9th to the 4th centuries BC. The bronze ware shows the prosperity of the settlement, and its pottery, which was handmade with painted decoration, demonstrates connections with the Peloponnese. Since antiquity the mountainous nature of the area has required the wintering of cattle in the plains and coastlands of Epirus.The Vitsa cattle breeders of antiquity lived in families and buried their dead in tombs with grave goods.

Apart from Vitsa, ancient sites have been located in the Mega Dendro area, next to the Voutsa monastery, where the ruins of ancient walls stand, and elsewhere. Moreover, at Kastraki, a hill near the village of Hagios Minas, there is an ancient fort with the remains of walls and houses. In the same area, ruins were found of the Byzantine city of Revnikon. There are also several post-Byzantine monasteries.

No historical sources exist for the early Christian times to the Middle Byzantine period, but we know that Epirus suffered invasions of Goths during the 3rd and 4th centuries AD and of Avars and Slavs during the 6th and the 7th centuries. The latter established settlements all over Epirus and some of the Slav place names of the area are probably survivals from these.

In the Middle Byzantine period Epirus belonged to the theme of Naupactus. Anna Komnene mentions the Norman invasions of the 11th century. From the time of the so-called Despotate of Epirus (13th–15th centuries) there is an increase in the historical evidence relating to Epirus and Zagori. Reference to Zagori is found in chrysobulls of Andronikos II Palaiologos, dated 1319 and 1321. A Byzantine document of 1326–28 refers to Papingo (either the village or the mountain) in Zagori. Evidence of settlements in the area during the 14th and the 15th centuries is found in the Ioannina Chronicle and the Tocco Family Chronicle, both of which contain rhyming accounts of historical events in the region. The people of Zagori joined Carlo II Tocco, count of Cephalonia, on his journey to Ioannina in 1411 where he was acclaimed despot.

In 1418 the Turks invaded Papingo and in 1430 they occupied Ioannina. During the Turkish occupation the region acquired great importance. The mountainous terrain offered many opportunities for settlement and security for the Greek population. In order to ensure their suzerainty over these areas, the Turkish rulers therefore granted them special political privileges, and the area became an autonomous prefecture with Papingo as its capital. By the 17th century the whole area had become a federation bearing the name *koinon* or *villayet* of Zagori. Apart from their administrative and political advan-

tages, the people of Zagori were also granted special taxation privileges as well as privileges relating to social and religious concerns, which were preserved till late in the period of Turkish occupation. Moreover, between 1790 and 1822, Ali Pasha increased these privileges for fear of the influence exerted by the powerful Constantinopolitans from Zagori over the sultan.

From the 17th century many of the inhabitants of the area emigrated, mainly to Moldavia and Wallachia, but also to Austria, Serbia, Russia, and Constantinople, where they became successful merchants and writers. The remittances of merchants from abroad were invested in Zagori, where the inhabitants continued to enjoy the freedom associated with their privileges. Apart from investments in the private sector, Zagorians also funded public works, and numerous bridges, public fountains, and roads, as well as schools and churches were constructed during this period. Teachers and priests were employed for the villages' needs by the rich inhabitants, resulting in impressive educational developments; all the villagers knew how to read and write at least. The monasteries and churches, the public buildings (schools and orphanages), the beautiful big houses of the area, all made of stone, stand today as proof of the prosperity of Zagori during the 18th and the 19th centuries.

Between the 15th and the 17th centuries several monasteries were founded in wonderful settings. They played an important religious, spiritual, social, and financial role over the next two centuries. During the 18th and the 19th centuries large parish churches were built to the plan of early Christian basilicas. During the first years of the Tourkokratia painters from Linotopi (in the area of Kastoria) and from all over Epirus, monks mainly, decorated churches in the Zagori area, some groups of painters from Epirus becoming famous during the 18th and the 19th centuries. Wood carving was also developed to a fine art, and there are many examples in churches and manor houses.

During World War II Zagori witnessed several campaigns and battles. Greek resistance to the Italian invasion lasted from late 1940 to 6 April 1941, when battles were fought in Grabala and Kalpaki. Many men from Zagori saw military service in the 8th Division under the command of general Katsimitros. The 15th Infantry Regiment fought a series of battles in the highlands of Kato Soudena. With the support of both the British and the Greek air forces the Greeks drove the Italians back to Argyrokastro between December 1940 and January 1941. Immediately after the German invasion (6 April 1941) the men from Zagori returned to their villages to organize the resistance movement and the rebel forces of EAM/ELAS (*Ethniko Apeleftherotiko Metopo*, the National Liberation Front, *Ellinikos Laikos Apeleftherotikos Stratos*, Greek Popular Liberation Army) and later EDES (*Ethnikos Dimokratikos Ellinikos Syndesmos*, the National Democratic Hellenic Union). It was because of these activities that the area suffered so much during the Italian and German occupation, when famine was a major cause of suffering. The urban population began to return en masse to the villages, since the threat of famine was greater in the cities. Yet the worst of the suffering came as a result of the savage German reprisals against the rebel forces. In 1943 whole villages were burnt to the ground all over Zagori. In 1944, after Allied victories, the Germans retreated and Zagori was liberated.

The victory was very soon besmirched, however, by the ensuing Civil War between the main rebel forces. Besides ELAS and EAM, EDES was organized and activated in Zagori, under the command of captain G. Lygerakis. The two forces had initially shared common headquarters for Zagori and Konitsa. But as the recriminations developed – ELAS accusing EDES of fascism, EDES regarding ELAS as communist – the conflicts in Central and East Zagori grew increasingly bitter. In Zagori the bitterness persisted long after the official cessation of hostilities.

Summary

A region of Epirus in northwestern Greece, Zagori is a mountainous area with Sarakatsans, Vlachs, and Gypsies as well as a native Zagorian population. The area was inhabited by Molossian tribes in antiquity. It belonged to the Despotate of Epirus in the 13th–15th centuries. During the Tourkokratia the population enjoyed many privileges and prospered. Zagori suffered badly in World War II and the Civil War, resulting in much subsequent depopulation.

Zealots

An ultraconservative Church party in modern Greece

The term "Zealot" designates someone who pursues a goal passionately, excessively, and perhaps fanatically; today it has mostly disparaging connotations. Yet, the term has been used positively in the past (cf. Acts 21: 20, 22: 3; 1 Corinthians 14: 12; Galatians 1: 14; Titus 2: 14) to indicate zeal for God and other good things. The members of a religiopolitical patriotic current within Judaism in the days of Jesus Christ were also called Zealots, as were the leaders of a revolt in Byzantium, who between 1342 and 1349 were in control of Thessalonica.

In modern Greece the term has been used in two, rather overlapping ways. In the first place, it refers loosely to Orthodox fanatics who are distinguished from the main body of the Church through their radical thinking, militant acts, and uncompromising positions. Such hardliners are included in the multidimensional current of Orthodox fundamentalism. Zealotry is exhibited in a variety of ways including devastating criticism of the official Church, which may finally lead to a schismatic movement, and militant and violent acts (e.g. the Rotonda incidents in Thessalonica in 1995) against real or alleged enemies of Orthodoxy. Orthodox zealotry is not only confined to marginal groups (e.g. the Old Calendarists); even leading members of the Church (e.g. Avgustinos Kantiotis, bishop of Florina) may exhibit signs of a zealotic mentality and pursue concomitant activities. The same spirit is sometimes shared by academic and other lay theologians.

In a narrow sense, the term "Zealots" was a self-designation of certain monks on Mount Athos who not only vehemently opposed the reform of the calendar by the patriarchate of Constantinople and the Church of Greece in 1924 (bringing Greece into line with the Gregorian calendar used in the rest of the Western world), but also broke communion with them. They founded organizations to promote their ideas, called themselves "True Orthodox Christians", and considered the New Calendar Churches to be schismatic, even heretical. They have also engaged in propaganda activities outside Athos since 1924. Two Zealot monks in particular, Arsenios Kotteas and Matthaios Karpathakis, made headlines because of their impact on the Orthodox flock and being the moving force of the "True Orthodox Christians". Their activities provoked a reaction not only from the official Church, but also from the Holy Community of Mount Athos. The Sacred Union of Zealotic Athonite Fathers or Sacred Union of Zealotic Monks, founded in April 1926, ceased to exist in 1927 according to the Constitutional Charter of Athos, Article 183 of which prohibited the foundation of monastic societies and organizations on the Holy Mountain. But its members as well as other Zealots continued their activities in other ways, both on Athos and elsewhere, and formed the backbone of contemporary Orthodox Zealotry.

Athonite Zealots used to live outside the monasteries, mostly in sketes or in other establishments near Megisti Lavra, until they brought the Esphigmenou monastery under their control in 1971. In total, they constitute approximately one quarter of the monks of Athos. Generally, the ruling monasteries do not accept the New Calendar. Yet, all of them, except Esphigmenou, maintain communion with the Orthodox authorities in Constantinople and Athens. Esphigmenou, however, shows an elitist attitude not only towards the Orthodox Church body in general, but towards the other monasteries as well. The Esphigmenites think of themselves as being the "most Orthodox" in the entire world, and suspect heresies and innovations almost everywhere. Since 1971 they have not commemorated the patriarch's name, due to Athenagoras's involvement in the ecumenical movement and his moves towards reconciliation with the Roman Catholic Church. In 1972 the other 19 Athonite monasteries expelled Esphigmenou's representative from the Holy Community. Since then Esphigmenou has followed an isolationist and separatist policy and joined the Old Calendarist group under archbishop Avxentios. Despite the counter-measures of the patriarchate of Constantinople, the Esphigmenites have not backed down and occasionally threatened extreme measures. At present their monastery is flourishing, and this is perhaps indicative of the wider appeal of zealotist ideals. The characteristic black banner on the monastery walls with the inscription "Orthodoxy or death" is indicative of their militant spirit. It is no wonder therefore that Esphigmenou was among the few monasteries that did not participate in the exhibition "Treasures of Mount Athos" in Thessalonica in 1997.

There are also various periodicals published by Zealots from Athos, such as *Agios Agathangelos Esphigmenitis* (St Agathangelos of Esphigmenou, formerly entitled *O Agios Simon o Myrovlitis*, St Simon the Myroblete), produced by the monk Iakovos. This contains only very critical articles and negative comments on all alleged anti-Orthodox policies, and supports with apocalyptic ardour traditionalist Orthodox views including the Old Calendar issue and the anti-ecumenical struggle. Another journal of related Zealotic line is *O Agioreitis* (The Athonite), published since 1978 by the monk Kallinikos.

The term "Zealots" has related to Athonite monasticism in recent times, and Athos is thus regarded by many as the most reliable bastion of the Orthodox tradition in the contemporary and radically changing world. Yet it should not be forgotten that zealotry, both historically and traditionally, has characterized many Orthodox believers and particularly monks in the past as well. The violent killing of the philosopher and mathematician Hypatia in 415 by Christians in Alexandria, despite its various underlying causes, was but one example of Christian zealotry. Various zealotic acts on the part of Orthodox monks were also castigated by the learned archbishop of Thessalonica Eustathios in the 12th century, who in his work *De emendanda vita monachica* pointed out their numerous transgressions and tried to ameliorate the overall condition of monastic life. Zealotic phenomena can also be observed later in the Kollyvades movement of the late 18th century as well as among other Orthodox (e.g. Kosmas Flamiatos). Needless to say, zealotic attitudes were very common in the wider Orthodox world as well, as an interesting dialogue between the Serb monk Dimitrije Obradović and a "Zealot" (Zilotij) in the 18th century reveals (Obradović, 1953). These cases attest to the fact that zealotry in its various expressions within (Orthodox) Christianity is not solely a contemporary phenomenon.

It goes without saying that Zealots in contemporary Greece, due to their ideas and acts, provoke negative reactions not only

from the official Church but also from the wider public. They are often considered as fanatics, vociferous protesters, intransigent, ultraconservative, bellicose undiscriminating ignoramuses, despite the fact that their intentions as guardians of the Orthodox faith are in some cases genuine and sincere. The official Church has been following their activities closely since the 1920s and has tried repeatedly to bring them under control. It also fears their challenge to its authority and their wider influence upon the Orthodox flock. Thus, the Church of Greece prohibited the activities of all wandering monks in any diocese without the permission of the local bishop (see the encyclical 2563 of 20 October 1993). On 14 December 1993 the patriarchate of Constantinople excommunicated the lay theologian Nikolaos Sotiropoulos of A. Kantiotis's movement, who was accused of troublemaking activities in the archdiocese of Australia. Moreover, through a State Council's decision in 1996, monks who do not acknowledge the direct spiritual jurisdiction of the patriarchate of Constantinople over Athos and do not commemorate the patriarch's name are not allowed to stay there. These incidents show that both the official Church and the state are negatively disposed towards the Zealots and intend to discipline them and neutralize their influence everywhere.

Summary

In antiquity there were Jewish Zealots in the time of Christ. And Zealots controlled Thessalonica in 1342–49. But in modern Greece Zealots are Orthodox fanatics and more specifically separatist monks (opposing ecumenical moves), based particularly on Mount Athos. About a quarter of all Athonites (and all the monks of the Esphigmenou monastery) call themselves Zealots.

Zeno of Citium 335–263 BC

Stoic philosopher

Zeno was the founder of Stoicism, a philosophical movement that had a great impact in the Greek and Roman world of the Hellenistic and imperial age. Stoicism was named after the place where Zeno used to teach in Athens, namely the Stoa Poikile (Painted Porch). Zeno, a Phoenician, came to Athens around 313 BC, and he studied first with Crates the Cynic, then with Stilpo and Diodorus of the Megarian school, and finally with Xenocrates and Polemo of the Academy. He had many students and he was well respected by the Athenians and also by Antigonus Gonatas who often attended his lectures and invited him to his court. His successor in the headship of the Stoic school was Cleanthes, but the most important contribution to Stoicism came later from Chrysippus. From Zeno's numerous writings we have only fragments from much later sources such as Cicero (1st century BC), Diogenes Laertius (2nd century AD), Galen (2nd century AD), and Stobaeus (5th century AD). Famous was his *Republic*, where he argued for a society of the wise who do not need the conventional institutions of a Greek city. The fullest account of his life and his doctrines comes from Diogenes Laertius (7. 1–160).

Zeno is accredited with the tripartite division of philosophy into logic, physics, and ethics. He is said to have started his course with logic, going on to physics, and finishing with ethics. Zeno's prime interest lies in ethics, but this interest motivated a physical enquiry and then an enquiry into logic. Yet all these parts are seen as part of an organic and coherent whole and thus none of them can be studied independently. Zeno's holistic understanding of philosophy results from his attempt to establish a system accounting for all aspects of a coherent and rational universe; reason (*logos*) and nature (*physis*) are the most crucial concepts for the Stoic understanding of the world.

Zeno put considerable emphasis on dialectic which included epistemology. He attempted to argue for the possibility of attaining cognition, an epistemic state midway between belief and knowledge. He argued that to know something is to have grasped it in such a way that one's grasp (*katalepsis*) cannot be shaken by argument. This grasp presupposes perception. Perception strikes our rational principle and generates impressions (*phantasiai*). Nature endowed us with the ability to form impressions of things, and impressions form the content of our mind – actually, rationality develops through them. Thus perception constitutes for Zeno a mental act to which we can

give assent. But not all impressions deserve assent. An impression deserves assent if it represents something as it is in reality, namely in such a clear way that it cannot possibly be false (Cicero, *Academicae Quaestiones*, 1. 41). These are cognitive impressions, i.e. they can convey knowledge. Zeno sharply contrasted secure assent (grasp) and weak assent, the latter amounts to ignorance. Yet a cognitive impression does not amount to knowledge; it still has to be confirmed by reason. For Zeno whatever does not qualify as knowledge amounts to ignorance. Accordingly he divided people into two categories, the foolish and the wise, the latter being the only one who knows. No intermediate state exists; unless someone is wise, he is foolish.

Zeno argued for two principles in the universe, the active and the passive. The passive principle is the qualityless (*apoios*) substance, the matter, while the active is the *Logos* in that which is called God (Diogenes Laertius, 7. 134). The whole of the universe is perfect, though destructible and subject to no other force but to itself. It was one of Zeno's fundamental ideas that every productive cause is corporeal and that only corporeal things can act. Thus mind and even God, the active principle, are corporeal. God, identified with fire, is the disposer of the things of nature and maker of the universe; it is also called reason and fate and is the determining force of all things. Zeno's account of nature is strongly teleological and his universe is very determinist; nothing happens in the world but by God's will and in accordance with God's providence. Fate not only governs everything but is defined as the reason by which the world goes on. For this reason divination is possible and can be true.

The world is considered to be a rational and intelligent being, a living organism with its own soul just as man has a soul. Human souls are fragments of the universal soul, man being an organic part of the cosmic whole. Zeno maintained that both the universal soul and the human soul are corporeal, a warm spirit (*pneuma*), which is the vitalizing force behind both humans and the universe itself. Soul has eight parts, the five senses, the faculties of reproduction and speech, and the rational principle (Diogenes Laertius, 7. 157). As the term of the rational principle suggests (*hegemonikon*, "governing principle"), there is nothing superior to this but this alone determines human life, even when it follows wrong reason. Zeno introduced some new terms to describe psychological or mental functions that take place in the rational principle such as "impulse", a soul's movement as a reaction to an impression. Man is free to follow an impulse by giving assent to an impression.

Zeno thought that philosophy had to show its fruits in ethics. According to Zeno, our goal is to live in accordance with reason, later formulated as living in accordance with nature. The law of nature can guide a man unerringly to virtue. Zeno maintained that virtue is something pertinent, endearing (*oikeion*) to the nature of man in the sense that nature directs man towards the acquisition of virtue. Therefore man should seek after virtue. In seeking virtue man is doing justice to its nature (*oikeiosis*), and being virtuous is a manifestation of one's rationality. Zeno held that only virtue has intrinsic moral value since only virtue is up to us. Therefore virtue is the sole good and the sole constituent of happiness. All other things, however good or bad, are regarded as morally indifferent (*adiaphora*). Within the group of indifferent Zeno distinguished three classes, the preferable, the non-preferable, and the indifferent. Natural advantages such as beauty and wealth are preferable. Accordingly Zeno distinguished between appropriate and perfectly appropriate acts; the first refer to preferable things, while the latter to morally valuable ones. Virtue is said to be one; individual virtues are inseparable and they constitute a state in which their possessor would always do the right thing. The smallest failure makes somebody unvirtuous. To be virtuous is the achievement of the wise man. As is the case with knowledge, so in ethics Zeno does not allow for any degrees of goodness. The wise man never fails in practising virtue, because of his acquired moral expertise; thus the wise man is free from all passions that would have a bad impact on his soul (Cicero, *Academicae Quaestiones*, 1. 39).

Zeno's doctrines were considerably modified by his successors. Yet he enjoyed a venerable status as the founder of the school. Later Stoics such as Posidonius (1st century BC) opposed their predecessors and tried to go back to Zeno's views. Stoic doctrines had an impact on Christian Fathers who shared the Stoic hostility to sceptics and Epicureans. Clement of Alexandria (*c.*AD 150–215) is likely to have had access to Zeno's writings, which by that time must already have become difficult to find.

Biography

Born at Citium in Cyprus in 335 BC, Zeno moved to Athens in 313 to study first under Crates the Cynic, then with Stilpo and Diodorus, and lastly with Xenocrates and Polemo of the Academy. He was founder and head of the Stoic school of philosophy. He was succeeded by Cleanthes. Only fragments of Zeno's writings survive. He died in 263 BC.

Zenobia

Queen of Palmyra in the 3rd century AD

Septimia Zenobia was born in Palmyra, to a family of the city's Graeco-Syrian elite. She claimed to have Macedonian blood, by descent from Antiochus IV Epiphanes, and a kinship with Cleopatra VII of Ptolemaic Egypt – this perhaps at a time when she felt herself heiress to a string of powerful women from the Hellenized east. The sources on her life and career are largely of a biased Western (Roman) nature – passages in the *Historia Augusta* and the later Byzantine histories of Malalas (6th century) and Zosimus (5th–6th century). However, the Arab historian Tabari (839–923), who refers to her as Zabba, places her in a localized scenario that is largely irreconcilable with the western sources.

Her marriage to Odenathus, who rose to become *dux oriens* under Roman suzerainty for his assistance in combating Persian advances, enhanced her position in the city where she claimed the title of queen. Odenathus and his son from a former marriage were murdered in AD 267 and from this time Zenobia ruled in the name of her eldest son Wahballat (Greek Athenodorus, Latin Vaballathus).

At this time Palmyra was at its cultural peak, and Zenobia sought to create a brilliant court by attracting a number of Graeco-Syrian literary figures. Foremost was the philosopher Cassius Longinus who, although a Syrian, had studied for years in Athens and upon his arrival in Palmyra composed a paean in praise of Odenathus. The *Historia Augusta* suggests that it was Longinus who tutored Zenobia in Greek and diplomacy and encouraged her revolt against Rome. This is unlikely since it is inconceivable that a woman of her position would not know Greek and her political skills (and reasons to revolt, see below), will have been honed over many years. Another well-known figure at the Palmyrene court was the sophist Callinicus of Petra who wrote a history of Alexandria – after Zenobia had conquered Egypt – and dedicated it to her under the name of Cleopatra. Perhaps the most important figure to arrive in Palmyra at this time was Paul of Samosata who fled from Antioch where he had been bishop, after being condemned as a heretic. Indeed, according to the sources, he converted Zenobia to Christianity, or even to Judaism. Although it is true that there was a sympathetic Jewish community in Palmyra and Zenobia is known to have paid for the restoration of a synagogue in Egypt, these views are thought to be an exaggeration. It is more likely that she displayed an intellectual curiosity, rather like the earlier Syrian empress Julia Domna, seeking information on Christian, Jewish, and even (according to Coptic sources) Manichaean doctrine. There is no reason to deny that she adhered to anything other than the Palmyrene sun cult.

It is probable that Zenobia would have been ignored by history were it not for the revolt she led against Roman power in the east. Much recent analysis has revealed, however, that although Rome's position there had been severely weakened, such a revolt is a simplification and that the brief flowering of a Palmyrene empire was based on more localized factors. The immediate reason may have been a frustration with what appeared to be the Roman disinclination to extend the preeminent position held by Odenathus to his heirs. There was also the need to bolster Palmyra's economic position at a period of commercial and financial instability in the East; thus it was an attempt to restore rather than create or enhance a position of financial preeminence within the eastern provinces. Lastly, the revolt would seem to have been deeply ensconced within a political power struggle among the Arab tribal federations of the area. Here, Tabari's account has been supported by recent epigraphic and archaeological evidence for an increased unrest among the tribes, jealous of Palmyrene hegemony. The *Historia Augusta* lists a wide range of Palmyrene allies based as far away as India, Persia, Ethiopia, and Yemen, suggesting that such a movement must have been far wider than merely anti-Roman. Latin inscriptions of Vaballathus give him the title "Arabicus Maximus" and this can now be understood as more than the mere aping of Roman imperial titulature. Moreover, the coins of Vaballathus have double portraits with himself on one side and the legitimate emperor Aurelian on the other, which indicates a desire for imperial association rather than any move to supplant western suzerainty.

The actual course of the revolt can be briefly described. Led by the general Zabdas, Palmyrene forces marched through Palestine and invaded Egypt in AD 269/70, ostensibly with fifth-column support in Alexandria, where one Timagenes (possibly a Palmyrene himself) is said to have raised Palmyrene support. Once Roman resistance had been finally crushed, Zenobia set about immersing herself in local support, using the name Cleopatra and paying for the restoration of a number of Egyptian monuments as well as a synagogue there. Turning north, Palmyrene forces captured Antioch, the great Syrian metropolis, in AD 270. From here coins were issued under the name of Vaballathus Augustus but now associated, significantly, with Zenobia Augusta rather than Aurelian – a clear statement of where the real power finally lay. The Palmyrene armies are said to have advanced through Asia Minor as far as Chalcedon, but after being repulsed from there, they held the country east of Ancyra.

The new Roman emperor Aurelian launched a strong counter-attack against what he clearly perceived as usurpers. Sending troops to Egypt, Aurelian himself led a larger army through Asia Minor, eventually confronting the Palmyrene forces outside Antioch and again in a decisive battle at Emesa where Aurelian captured Zenobia's war chest. From here Zenobia fled towards Palmyra where the Roman forces arrived to besiege her. The exchange of letters between Zenobia and Aurelian recorded in the *Historia Augusta* at this time is clearly a fiction. Nevertheless the besieged suffered a blow when their Armenian allies defected to the Roman side. Zenobia thereupon fled towards Persia – whence she had expected help – but was caught at the Euphrates by Roman cavalry. The city now opened its gates to Aurelian and it is clear that he was welcomed by some of the population there. The long struggle over, a garrison was installed and Aurelian set off for Rome. After crossing into Europe, however, he heard that the garrison had been massacred and another Palmyrene noble, thought to have been a relative of Zenobia, had raised the standard of revolt once more. Furthermore there were also disturbances in Egypt, again possibly fermented by Palmyrene agents. Aurelian hastily returned, at a speed that surprised the Palmyrenes, and this time made no misrake by sacking the entire city. Thus was

Palmyrene independence, and to a large extent Palmyrene culture and wealth, extinguished.

Zenobia is said to have been paraded in Aurelian's eventual triumph through Rome, loaded down with chains of gold. Most sources agree, however, that she in fact ended her days in a villa at Tivoli just outside Rome and there are even suggestions that she may have married again.

Zenobia the queen of Palmyra has passed into Western, and Arabic, literature as a romantic figure. Most emphasize her beauty, her chastity, and above all her bravery, stamina, and fortitude in taking on the might of Rome. Nevertheless, she must also be remembered as an agent of the distinctive Graeco-Syrian culture that was Palmyra's, tempered with an enquiring mind in the best traditions of the far-flung Hellenic world.

JULIAN M.C. BOWSHER

Biography

The second wife of Septimius Odenathus of Palmyra in Syria, on his death in AD 267 Zenobia assumed power on behalf of her son. Palmyra was at its cultural peak and she attracted writers to her court. Leading a revolt against Roman power, her forces conquered first Egypt in 269–70 and then Antioch and much of Asia Minor. Finally subdued by Aurelian in 272, Zenobia died at Tivoli near Rome.

Zervas, Napoleon 1891–1957

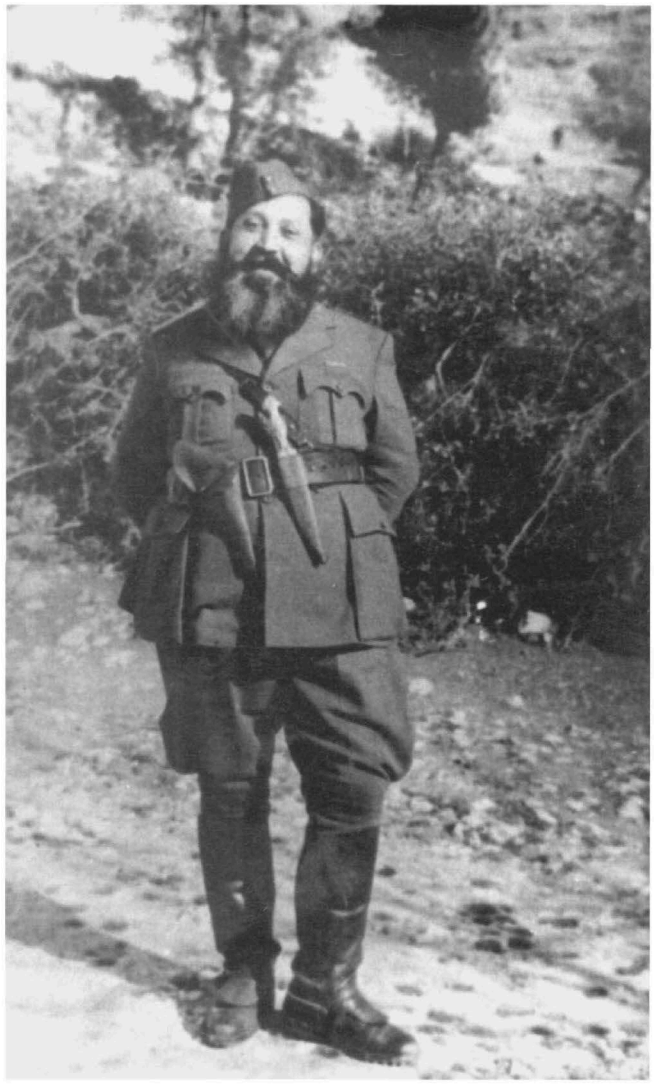
Resistance leader

Napoleon Zervas was one of the preeminent leaders of the national resistance movement in Greece in both the political and the military realms. Born in the province of Arta, Zervas enlisted in the Greek national army upon completion of his schooling as a volunteer, and at the age of 21 had his first encounter with the battlefield in the Balkan Wars (1912–13). Shortly before the outbreak of World War I Zervas studied briefly at the academy for non-commissioned officers and in 1914 received the rank of second lieutenant.

The Greek political sphere was divided between the supporters of neutrality represented by king Constantine and the advocates of an active alliance for involvement in the war led by the prime minister Eleftherios Venizelos. Zervas supported the Venizelist movement from the outset and participated in the Macedonian front, which in 1918 resulted in the armistice with Bulgaria. For his contribution to the campaign and for his valour and courage Zervas was in 1920 promoted to the rank of major. As a staunch supporter of the democratic movement he was forced to flee following the defeat of Venizelos in the elections of 1920. He moved to Constantinople where he joined the Venizelist support group, always in anticipation of his return to Greece. In 1922 he was given that opportunity and immediately upon returning to Athens joined the armed forces, becoming within a short period of time a lieutenant colonel.

The devastating losses of the Asia Minor campaign had a disastrous impact both militarily and politically. The political vacuum resulted in the dictatorship of Theodoros Pangalos in June 1925. Zervas, who was closely associated with the general, became garrison commander of Athens and in August 1926 was placed as adjutant to the president of the republic, Pavlos Kountouriotis. Zervas had the crucial role of battalion commander of one of the two main battalions that guarded Athens and supported general Pangalos. Zervas, taking advantage of the political instability, was quick to join the counter-coup of 22 August 1926 by Georgios Kondilis. As a reward he received full command of the Athens brigade, which had previously been divided between himself and lieutenant colonel Panagiotis Dertilis. A few days after his appointment, however, Kondilis decided to disband the Democratic Guard responsible for the protection of the city, which resulted in the outbreak of hostilities between units supporting Zervas and government forces. The deadly battles fought in the streets of Athens ended in defeat and a sentence of life imprisonment for Zervas. Two years later, following the return to power of the Venizelists, Zervas was released. He withdrew from politics, only to return following the invasion of Greece by the Axis troops in April 1941. With the assistance of liberal democrats and under the guidance of general Nikolaos Plastiras, who at the time was in self-imposed exile in France, Zervas founded in September 1941 the *Ethnikos Dimokratikos Ellinikos Syndesmos* (EDES, the National Democratic Hellenic Union). The goals of this movement were the expulsion of the occupation forces and a return to parliamentary democracy. Zervas established a paramilitary organization in June 1942 which waged a guerrilla war against the Italian and German forces. The Ethnikes Omades Ellinon Antarton (EOEA, National Bands of Greek Rebels) were a paramilitary faction of EDES and were involved in sabotage missions against the Axis, including the destruction of the Gorgopotamos bridge on 25 November 1942.

Zervas remained actively involved in the guerrilla movements throughout the war, but his forces were inferior to the power of EAM *(Ethniko Apeleftherotiko Metopo*, the National Liberation Front) and its military wing ELAS *(Ellinikos Laikos Apeleftherotikos Stratos*, the Greek Popular Liberation Army). After the end of the war, EAM/ELAS oscillated between concealed and open resistance, according to political circumstance, refusing to recognize the postwar Greek government of Papandreou. The superiority of the EAM forces resulted in the loss of the Epirus region which Zervas had secured during the occupation. He was forced to retreat to Corfu where he retired from military life in March 1945 with the rank of lieutenant general.



Napoleon Zervas

Aware of the political vacuum once again, Zervas remained active not as a military figure, but as the founder of the National Party. During the elections of 1946 he secured 20 seats in Parliament and later served as minister of public order (1947) in the government of Dimitrios Maximos. In the elections of 1950 Zervas lost 13 seats and had to create an alliance with the Liberal Party. He served as minister of public works under the government of Sofoklis Venizelos (1950–51). During the elections of 1952 Zervas was unable to accumulate enough votes to secure any seats in Parliament and retired from the political scene. He died five years later, having served the democratic causes in which he believed.

STELIOS ZACHARIOU

Biography

Born in 1891 in the province of Arta, Zervas fought in the Balkan Wars (1912–13). In World War I he supported Venizelos and fought on the Macedonian front. He became garrison commander of Athens in 1925 and commander of the Democratic Guard in 1926. In 1941 he founded the National Democratic Hellenic Union (EDES) and engaged in sabotage missions against the Germans and Italians. After the war he served twice as a government minister. He died in 1957.

Zoe *c.*978–1050

Empress

Empress Zoe and her younger sister Theodora were the last surviving heirs of the Macedonian dynasty of the Byzantine empire. They were the second and third daughters respectively of Constantine VIII (1025–28); the eldest, Evdokia, had entered religious life. Zoe and Theodora occupy a unique place in Byzantine history, in that they were the only princesses born in the purple (*porphyrogennetai*) to be the bearers of dynastic legitimacy to the throne. Other empresses, such as Irene (780–802) and Evdokia (1067; again in 1071), ruled only through their rights as widows and/or mothers of emperors.

Constantine VIII waited until he was on his deathbed to find himself a son-in-law and successor to marry Zoe. His choice was Romanos Argyros, eparch of the city of Constantinople. Romanos and Zoe were married on 12 November 1028, and Romanos ascended the throne as Romanos III (1028–34) on Constantine's death three days later. Zoe was at that time nearly 50 years of age. Michael

Psellos, in his *Chronographia*, reports that the royal pair consulted fertility experts when they failed to conceive a child. Indeed, Psellos claims that Zoe even resorted to magical practices, but with no success. The couple gave up, and each took other lovers. Zoe fell in love with a young man from Paphlagonia named Michael, the brother of John the Orphanotrophos, an influential eunuch at court.

Romanos died in his bath on 11 April 1034, ostensibly murdered by the agents of Michael and Zoe. The lovers married that evening, and Michael became emperor Michael IV (1034–41). He quickly lost interest in Zoe; she had merely been his route to power. He kept her under guard in the women's quarters, fearing that she might take revenge against him. But Zoe suffered quietly, and agreed to adopt his nephew, also named Michael, as her son and heir. This scheme was engineered by John the Orphanotrophos, who wanted the throne to remain in his family.

Michael IV died of epilepsy on 10 December 1041. The new emperor, Michael V Kalaphates (1041–42), turned against those who had raised him to the throne: first he exiled his uncle, John the Orphanotrophos; then he banished the empress Zoe to a convent. A popular uprising ensued, fuelled by the feeling that Zoe (and Theodora) were the legitimate rulers of the empire by right of their birth. Michael was viewed as a usurper, and so was deposed and blinded on 20 April 1042. Zoe and Theodora ruled jointly for three months, until Zoe decided to marry once more. She chose Constantine Monomachos, a senator, who ruled as Constantine IX (1042–55). The two empresses shared the throne with Constantine but left the running of government affairs to him. Zoe even accepted his mistress, Sklerena, and agreed to honour her with the newly created title *Sebaste* ("Augusta"); the mistress ranked just below the emperor and the two empresses. These four proceeded to empty the treasury of funds, contributing to the decline of the Byzantine state in the 11th century.

While Zoe did not actively engage in politics herself, the rule of her consorts was characterized by the rise of the civil aristocracy and policies which favoured that party's interests. Landed magnates also began to increase their power and wealth at the expense of the small-holdings of soldiers and free peasants. According to George Ostrogorsky, the emperors themselves are not entirely to blame for these developments: "They were merely the exponents of vigorous and irresistible social and economic forces" (p. 323).

Zoe loved much and was known for her generosity, long-suffering, and piety; she also committed murder, hated her sister, and dabbled in the occult. She also spent money on costly incense and on materials used to manufacture perfumes and ointments, an unusual hobby that she and Theodora shared. Psellos expresses surprise that Zoe preferred this hobby to more typically feminine occupations such as weaving and needlework; nor did she adorn herself in luxurious gowns as one might expect a woman of her rank to do. He does, however, comment with approval on Zoe's piety. Thanks to Psellos's observations we have some idea of how Zoe compared to the ideal aristocratic woman of her time.

Empress Zoe died in 1050, during the reign of Constantine IX, who survived her by five years. After Constantine's death in 1055, Theodora ruled again in her own right for less than two years until her death in 1056. Zoe and Theodora, as the last members of the Macedonian dynasty, were the only women in Byzantine history to rule as empresses by right of birth. Zoe was also unique in that she was the only empress to give legitimacy to her husbands' rights to the throne: they became emperors only because of her own dynastic inheritance. A mosaic portrait of Zoe and Constantine IX flanking the enthroned Christ survives in the south gallery of Hagia Sophia in Constantinople.

Zoe: mosaic showing Christ enthroned between Zoe and Constantine IX Monomachos, Hagia Sophia, Constantinople, 11th century

CONSTANTINA SCOURTIS

Biography

Born *c.*978 the second daughter of Constantine VIII, Zoe and her sister Theodora were the last heirs of the Macedonian dynasty. Her husbands were Romanos III (r. 1028–34), Michael IV (r. 1034–41), and Constantine IX (r. 1042–55). Zoe and Theodora reigned jointly from 21 April to 12 June 1042, the only women in Byzantine history to do so by right of birth. Zoe died in Constantinople in 1050.

Zonaras, John

Historian, theologian, and canonist of the 12th century

Born in the last decade or two of the 11th century, Zonaras achieved a certain distinction in the service of Alexios I Komnenos (1081–1118), acting as a judicial official (*megas droungarios tes viglas*) and as head of the imperial chancellery

(*protasekretis*). He appears, however, to have fallen out of favour with the imperial family, probably because of his criticism of Alexios's financial policies, particularly the distribution of public money and properties to his relatives, and shortly after the accession of Alexios's eldest son John II (1118–43) Zonaras was dismissed from court and became a monk at the monastery of St Glykeria. Here he composed his massive *Epitomi Historion*, a summary of history in 18 books beginning with the creation of the world and continuing to the death of Alexios in 1118. The latter portions of this history (especially book 18. 21–29) preserve his critical views of Alexios's reign and act as a polemical counterbalance to Anna Komnene's lengthy eulogy of her father. For the earlier sections of his history Zonaras relies on a wide variety of sources – biblical, Classical (e.g. Arrian, Cassius Dio, Herodotus, Xenophon, Plutarch, Philostratus), and near-contemporary (especially Psellos and Skylitzes). Especially valuable are the sections of his narrative that reflect sources now lost, in particular his account of the so-called Neo-Flavian emperors Constantius II and Julian "the Apostate", preserving content from the histories of Philostorgius and Theophanes. Even more valuable is Zonaras's summary of early Roman history, since it is based largely on the lost books 1–21 of Cassius Dio's *Roman History*, a work that was highly esteemed among Byzantine scholars, especially for its insights into the foundations of the principate, a form of government that they found not unlike their own. Zonaras's interest in Dio may have been prompted by the *Epitome* of the Roman historian assembled by Xiphilinos, a well-known and near-contemporary literary figure who was prominent early in the reign of Alexios I. Zonaras reflects a close dependence on Xiphilinos's work for his narrative of events following Trajan's reign (AD 98–117), but his techniques of compression produce a result rather more coherent and intelligible than that of his countryman. Zonaras's *Epitome* was used extensively by later scholars, notably Constantine Manasses and Michael Glykas, and was translated into Serbian, Old Church Slavonic, and later, during the Renaissance, into Latin, French, and Italian. No English translation has yet been produced.

In addition to the *Epitome* Zonaras also wrote important *Commentaries* (*Patrologia Graeca* [*PG*], 137 and 138) on the Apostolic Constitutions, canons of councils, and the Church Fathers. Cardinal Pitra, the eminent 19th-century Church legal scholar, described Zonaras as "easily the most eminent of all commentators on Byzantine law" (*facile omnium juris byzantini magistrorum princeps*), and it is evident that Zonaras's *Commentaries* were closely consulted by other respected canonists, including Alexios Aristenos and Theodore Balsamon. Zonaras carefully distinguishes (*PG* 137. 509) "the investigation of dogma and decisions (*psephoi*) from formal canons which bore the authoritative signature of emperors and fathers".

Zonaras is also known to have written a synodal monograph (*PG* 119. 741–42) concerning degrees of consanguinity as they pertained to marriage law, as well as a synodal oration (*PG* 119. 1011–32) examining the moral implications associated with seminal discharge (*physiki tis gonis ekroi*). From a letter of Michael Glykas we hear of a poem written by Zonaras in which doctrine concerning the nature of the Holy Spirit is disputed.

Among Zonaras's homiletic and hagiographic writings are sermons for the feast of the Hypapante, commemorating the presentation of the infant Christ in the Temple, as well as one for the Sunday of the Veneration of the Cross; also a *Life* of pope Silvester I, celebrating the popular legend that it was he who had baptized Constantine the Great in Rome. Until 1913 this work had been published only in Latin translation and had been attributed to Symeon Metaphrastes. The anonymous editor of the original Greek text (*Roma e l'Oriente*, 6 (1913): pp. 340–67) has adduced linguistic and historical evidence that has convinced most scholars that Zonaras was, indeed, the author of this biography. Also among Zonaras's writings are commentaries on the writings of John of Damascus pertaining to Church precepts regarding the Resurrection, as well as on the epigrams of Gregory of Nazianzus (*PG* 138), and finally a Canon (hymnographic verse), in the Theotokion mode, concerning various heresies (*PG* 135. 413–422). Attested, but no longer extant, are Zonaras's summaries of the writings of Cyril of Alexandria, Sophronios, patriarch of Jerusalem, and a *Life* of St Eupraxia. A lexical collection of words from important books preserved under Zonaras's name is almost certainly not his work but rather that of an otherwise unknown Antonios Monachos.

No firm date can be established for Zonaras's death, but because his *Commentary* on the Canons appears to reflect familiarity with that of Alexios Aristenos, written in the late 1150s, some date shortly thereafter may be suggested.

M. JAMES MOSCOVICH

Biography

Born in the late 11th century, Zonaras became a judicial official at the court of Alexios I Komnenos. Dismissed by John II, Zonaras became a monk. His chronicle *Epitomi Historion* summarizes history from the Creation to 1118. He also wrote commentaries on Byzantine law, sermons, and other works. He died in the late 1150s.

Zoology

It would not be entirely true to say that no Greek philosopher before Aristotle took an interest in the animal kingdom. Anaximander in the 6th century BC had speculated on the origins of animal life; Empedocles had included animals in his account of the cosmic cycle; and the Hippocratic treatises show some interest in the systematic study of animals in the context of their therapeutic value. None of this, however, shows signs of any but the most superficial observation. Democritus the atomist is credited with a treatise on zoology, but we have no idea what it contained; reports that survive, largely in the works of Pliny, consist of no more than disconnected anecdotes, without a context (indeed it is sometimes doubted whether Pliny's Democritus is the same as the philosopher). Plato's method of division embraces the classification of animals, but they are mentioned hardly at all in his surviving works. His successor Speusippus wrote a work called the *Homoia*, or Similarities, on defining classes on the basis of characteristics that individual members have in common, and he seems to have included animals in this process, but we know little about the work.

The fact that Aristotle, the author of the first surviving zoological treatises, feels the need to defend the study of animals (*On the Parts of Animals*, 644b22–646a4) gives a clue to reasons for the comparative neglect of this field. The imagined objectors against whom he directs his defence (presumably Platonists) regard animals as insignificant and distasteful, and are shocked by the prospect of the unpleasant task of dissection. They prefer the study of grander themes such as astronomy and cosmology, whose subjects are unconditionally beautiful and which admit of a degree of precision and absolute truth not possible in the study of the messier works of nature. Aristotle counters by pointing out that, lowly though they are, animals are at least accessible to close and detailed observation (unlike the heavenly bodies), and argues vigorously that all of the works of nature show purpose, and contribute to an end, and for that reason are intrinsically beautiful.

Five principal zoological treatises of Aristotle survive: *The History of Animals*, *On the Parts of Animals*, *On the Reproduction of Animals*, *On the Motion of Animals*, and *On the Progress of Animals*. They are, by any standards, remarkable works. Between 500 and 600 different kinds of animals are discussed, sometimes in considerable detail. There is clear evidence of the systematic collection of data throughout Aristotle's career. Place names mentioned suggest that he was already gathering information in northwest Asia Minor and on Lesbos, which he visited in the period between leaving the Academy in Athens and becoming the tutor of the future Alexander III of Macedon. There is no positive evidence from Aristotle's own works to support the suggestion that is sometimes made, both in antiquity and by later writers, that Alexander sent Aristotle interesting specimens gathered as he travelled east into the Persian empire. Nevertheless, the story should not be dismissed out of hand. For example, Aristotle is exceptionally well informed about the diet, capacities, habits, and anatomy of the domesticated elephant, and it may well be that reports on the animal had been sent to him in the course of Alexander's campaigns in the east. Elsewhere, much of his information seems to have been derived from questioning fishermen, herdsmen, beekeepers, and travellers, among others. What is more, there are clear signs that Aristotle dissected a good number of specimens (or at any rate had access to reports of such dissections). He is credited with a work on dissection (now lost), and his extant works contain frequent references, not only to the results of dissection, but also to the technical problems involved (for example, he was aware that an animal killed by having its throat cut will not have its circulatory system in a normal condition, and recommends strangling instead; but his belief that the heart has three rather than four chambers suggests that his own technique may have been just as unsatisfactory). For the most part, however, the care and meticulousness of the observations are very impressive. For example, he describes in detail the development of a chick inside an egg (*The History of Animals*, 561a4–29): after three days, he says, the embryo of the chick can already be seen; later the parts of the body can be distinguished – first the heart and veins, then the head and the eyes; by the tenth day the chick itself is clearly distinguishable (and he describes what can be seen if one of the eyes is dissected); finally, the chick is ready to hatch on the twentieth day. This series of observations could have been made only as the result of a deliberately planned programme of investigation. One of the best known of his systematic descriptions is that of the reproductive system of the dogfish. This fish, like a number of other closely related fishes, bears live young, but Aristotle reported that it is unusual in that before birth the embryo is attached to its mother by a structure similar to the navel-string and placenta in mammals. It was only in 1842, after centuries of scepticism, that it was confirmed (by Johannes Müller) that Aristotle's account was essentially correct.

Impressive though this is, Aristotle is by no means infallible, and his works contain numerous mistakes. Some seem to be the result of simple observational error (such as his belief that a lion's neck contains only one bone, or that the heart has only three chambers). Sometimes, he seems to have been misled by fanciful travellers' tales (such as the report that hares invariably die if they are imported into Ithaca, or that the bite of the gecko is fatal in Italy). More significantly, he sometimes misleads himself by the inappropriate application of general principles, as when he argues that worker bees are neither male nor female, on the grounds that no female animal has defensive weapons (and worker bees have a sting), and no male animals care for their young (as worker bees do). Applying the same principles to queens (or "kings", as Aristotle calls them) and drones, he concludes that all three kinds of bee reproduce parthenogenetically, from their own kind. It must, however, be said, in Aristotle's defence, that the task of sexing a bee, using the resources he had available, would be by no means an easy one.

It is not at all clear what Aristotle thought was going to be the end result of his zoological researches. Although there is certainly evidence of systematic collection of material, the actual arrangement of the pieces of information in his zoological works shows no obvious system; facts are roughly grouped together by topics, but the structure of the classification remains obscure. It is too easy to assume that Aristotle was aiming at the sort of classification of animals that biologists, following Linnaeus, achieved from the 18th century onwards.

Though Aristotle's work can undoubtedly be regarded as the foundation on which later scientists built, it may well be that his own purposes were quite different from theirs, and that his collection of zoological facts was actually intended to be the raw material for his study of the purposive working out of nature's goals, or for an exercise in putting into practice his logical theories. Even so, the quality of his empirical investigations remains impressive, and without precedent until modern times.

After Aristotle, his pupils and associates continued with his work (and indeed it is likely that many of Aristotle's zoological treatises were themselves the result of collaborative work). His successor Theophrastus wrote *On the Character and Intelligence of Animals*, and a number of other works on the behaviour of different classes of animal, all of which have been lost. One short zoological work of Theophrastus, however, *On Fish*, does survive. It deals with the apparent anomaly of fish and other sea creatures which can sometimes be found surviving on dry land, or may even be dug up out of the ground, and shows evidence of careful observation of a variety of species. Theophrastus' successor as head of the Lyceum, Strato of Lampsacus, is also credited with works on zoology.

In the Hellenistic period some physicians (Herophilus, for example) seem to have taken an interest in comparative anatomy, and the surgeon Sostratus (1st century BC) is credited with the books *On Animals*, *On the Nature of Animals*, and *On Animals Which Sting and Animals Which Bite*. Dissection of animals later became a standard tool of medical research, but the real centre of interest is the human being. The same can be said of later writings on animal behaviour, which was of interest only in so far as it illuminated or provided models for human behaviour. Epicurus, for example, cited the alleged fact that animals invariably seek pleasure and avoid pain as proof that hedonism is natural (and his opponents the Stoics used zanimal examples to assert the opposite). Similarly, Plutarch investigated the question of whether animals are capable of exercising reason. This tradition was continued by Christian writers such as Origen and Basil of Caesarea, who used reports of animal behaviour derived from Aristotle and other Greek writers to illustrate moral arguments and as symbols representing theological positions.

The *Natural History* of the Roman writer Pliny the Elder contains a mass of facts about various animals, treated mostly as interesting curiosities without serious attempts at classification, and the same can be said of *On the Nature of Animals* and *Varia Historica* of Aelian. Both draw extensively on the writings of earlier Greek zoologists (indeed, more than two-thirds of Pliny's sources are Greek). The ultimate source of much of their information seems to be Aristotle himself, but these later writers seem not to have consulted his texts (or those of other authorities such as Theophrastus) directly, but to have used collections of excerpts (such as that of Pamphilius), summaries (such as that of Aristophanes of Byzantium), or works which are heavily dependent on earlier sources (such as Alexander of Myndos's *On Animals*). In other words, their works are in no way empirical studies, but are purely literary compilations drawing on reference works. It is in fact this moralizing and anecdotal tradition of zoology that passed on into the Middle Ages; it was only with the scientific revolution of the 17th century that Aristotle's systematic studies became the foundation of modern zoology.
